To date, thirteen water channel proteins (AQP0, AQP12) have been cloned, and the mechanisms and physiological functions of water transport across biological membranes have long been the subject of interest. Recent advances in the molecular biology and physiology of water transport have yielded new insights into how and why water moves across cell membranes, and studies on aquaporin knockout mouse models suggest that aquaporins are

involved in the development of some diseases and they may be useful targets of research into selective inhibitor drugs By focusing on the advances made over the last 30 years in the biophysics genetics protein structure molecular biology physiology pathophysiology and pharmacology of aquaporins in mammalian cell membranes this book provides novel insights into further mechanisms and the physiological significance of water and some small molecule transport in mammals in order to stimulate further research in new directions In the second version fourteen chapters will be updated base on the most recent research articles Ten new chapters will be added
