Filters output a vibration suppression gain for suppressing resonance of a sub frame or shimmy by performing a filter processing on a rotational angle of a motor. The filters have respective frequency characteristics that a gain becomes a maximum magnitude and a phase advances by 90 degree at a cut off angle frequency. The cut off angle frequency of the filter is fixedly set at a resonance frequency of the sub frame. The cut off angle frequency of the filter is variably set in accordance with a tire rotation frequency. A gain adder adds the respective gains of the filters and outputs an added magnitude to a correcting mechanism as a vibration suppression gain. The correcting mechanism corrects a motor torque set by an assist map by using the vibration suppression gain outputted by the gain adder.      Suppression of Noise and Vibration in Electric Power Steering Systems Mary Kathryn Freund, 2018      A Comparative Study of Power Consumption of Electric Power Steering System Mohd Khair Hassan, 2012      **Torque Steer Mitigation Using Electric Power Steering (EPS) System**, 2007
