Dutoit, Raymond McCall, Ivan Mistrik, Barbara Paech, 2007-02-02 Thirty years ago I first entered the dark realm of software engineering through a prior interest in documentation In those days documentation pretty much meant functional specifications The idea that stakeholders in a system its implementers its end users its maintainers and so forth might want something other than an alphabetic list of function definitions was just taking hold There was an exciting to me vision of stakeholders accessing and contributing to explanations of how and why aspects of a system work as they do tradeoff analysis of concomitant downsides and perhaps even accounts of why other possible approaches were not followed There were many challenges to overcome in achieving this vision The most formidable is the belief that people do not like to create or use do mentation This negative image of documentation is unfortunately more than just the bias of a few incorrigible

system developers It is more like a deep truth about human information behavior about how human beings construe and act towards information Humans are by default active users of information they want to try things out and get things done When documentation is interposed as a prerequisite between people and a desired activity they try to skip through it circumvent it or undermine it Designing information to suit the needs and interests of its users is an abiding challenge but we have come a long way from functional specifications as the only answer
