Shiga toxin-producing Escherichia coli in human, cattle and foods. Strategies for detection and control Nora Lía Padola, Analía Inés Etcheverría, 2014-11-11

Shiga toxin producing Escherichia coli STEC is an important foodborne pathogen associated with both outbreaks and sporadic cases of human disease ranging from uncomplicated diarrhoea to haemorrhagic colitis HC and haemolytic uraemic syndrome HUS STEC affects children elderly and immuno compromised patients STEC is capable of producing Shiga toxin type 1 Stx1 type 2 Stx2 or both encoded by stx1 and stx2 genes respectively These strains are likely to produce putative accessory virulence factors such as intimin encoded by eae an enterohaemolysin EhxA and an autoagglutinating protein commonly associated with eae negative strains Saa both encoded by an enterohaemorrhagic plasmid Several studies have confirmed that cattle are the principal reservoir of STEC O157 and non O157 H7 serotypes and many of these serotypes have been involved in HUS and HC outbreaks in other countries Transmission of STEC to humans occurs through the consumption of undercooked meat vegetables and water contaminated by faeces of carriers and by person to person contact Diagnostic methods have evolved to avoid selective diagnostics currently using molecular techniques for typing and subtyping of strains Control is still a challenge although there are animal vaccines directed against the serotype O157 H7

Schaechter's Mechanisms of Microbial Disease ,2012-05-15 Schaechter s Mechanisms of Microbial Disease provides

students with a thorough understanding of microbial agents and the pathophysiology of microbial diseases The text is universally praised for telling the story of a pathogen in an engaging way facilitating learning and recall by emphasizing unifying principles and paradigms rather than forcing students to memorize isolated facts by rote The table of contents is uniquely organized by microbial class and by organ system making it equally at home in traditional and systems based curricula Case studies with problem solving questions give students insight into clinical applications of microbiology which is ideal for problem based learning

Surveying Antimicrobial Resistance: The New Complexity of the Problem

Gilberto Igrejas, José Luis Capelo, Carlos Lodiero, Patrícia Poeta, 2020-07-10 In January of 2015 under the 1st International Caparica Conference in Antibiotic Resistance a Research Topic entitled Surveying Antimicrobial Resistance Approaches Issues and Challenges to overcome was published <http://journal.frontiersin.org/researchtopic/3763/surveying-antimicrobial-resistance-approaches-issues-and-challenges-to-overcome> The problem of antimicrobial resistance AMR caused by excessive and inappropriate use of antibiotics is a public health issue that concerns us all The introduction of penicillin in the 1940s the start of the antibiotics era has been recognized as one of the greatest advances in therapeutic medicine However according to the World Health Organization WHO AMR infections are now an increasing worldwide public health threat and a post antibiotic era is imminent where common infections and minor injuries could be fatal AMR is a typical One Health problem in which livestock animals and the environment constitute AMR reservoirs and transmission routes to and from the human population Without effective antimicrobials to counter and prevent infections other major achievements in modern medicine such as organ transplantation cancer chemotherapy and major surgery risk being compromised AMR infections in animals have negative outcomes on animal health welfare biosecurity and production In 2006 the ban of growth promoting antibiotics highlighted antibiotic use in animal production as a risk factor in the development of antibiotic resistant bacteria Bacteria can be transferred to humans via several routes consumption of animal products exposure through contact with animals and the contamination of ground and surface waters by animal waste products Therefore it is of utmost importance that antimicrobial use in animals is reduced to a minimum without compromising animal health and welfare Mechanisms of bacterial antibiotic resistance are classified according to the types of antibiotic molecules or their targets in the cell Environmental antibiotic resistance genes are spread then acquired by clinically relevant microorganisms Many resistance genes are conveyed into pathogen genomes via mobile genetic elements such as plasmids transposons or integrons increasing the propagation of potential resistant pathogens Substantial progress has already been made in elucidating the basic regulatory networks that endow bacteria with their extraordinary capacity to adapt to a diversity of lifestyles and external stress factors So how will we face bacteria in the future
