Analysis and Optimization for Robust Millimeter-Wave Communications Cristian Tatino,2021-01-13 Spectrum scarcity is a longstanding problem in mobile telecommunications networks Specifically accommodating the ever growing data rate and communications demand in the extensively used spectrum between 800 MHz and 6 GHz is becoming more challenging For this reason in the last years communications in the millimeterwave mm wave frequency range 30 300 GHz have attracted the interest of many researchers who consider mm wave communications a key enabler for upcoming generations of mobile communications i e 5G and 6G However the signal propagation in the mm wave frequency range is subject to more challenging conditions High path loss and penetration loss may lead to short range communications and frequent transmission interruptions when the signal path between the transmitter and the receiver is blocked In this dissertation we analyze and optimize techniques that enhance the robustness and reliability of mm wave communications In the first part we focus on approaches that allow user equipment UE to establish and maintain connections with multiple access points APs or relays i e multi connectivity MC and relaying techniques to increase link failure robustness In such scenarios an inefficient link scheduling i e over or under provisioning of connections can lead to either high interference and energy consumption or unsatisfied user s quality of service QoS requirements In the first paper we propose a novel link scheduling algorithm for network throughput maximization with constrained resources and quantify the potential gain of MC As a complementary approach in the second paper we solve the problem of minimizing allocated resources while satisfying users QoS requirements for mm wave MC scenarios To deal with the channel uncertainty and abrupt blockages we propose a learning based solution of which the results highlight the tradeoff between reliability and allocated resource In the third paper we perform throughput and delay analysis of a multi user mm wave wireless network assisted by a relay We show the benefits of cooperative networking and the effects of directional communications on relay aided mm wave communications These as highlighted by the results are characterized by a tradeoff between throughput and delay and are

highly affected by the beam alignment duration and transmission strategy directional or broadcast The second part of this dissertation focuses on problems related to mm wave communications in industrial scenarios where robots and new industrial applications require high data rates and stringent reliability and latency requirements In the fourth paper we consider a multi AP mm wave wireless network covering an industrial plant where multiple moving robots need to be connected We show how the joint optimization of robots paths and the robot AP associations can increase mm wave robustness by decreasing the number of handovers and avoiding coverage holes Finally the fifth paper considers scenarios where robot AP communications are assisted by an intelligent reflective surface IRS We show that the joint optimization of beamforming and trajectory of the robot can minimize the motion energy consumption while satisfying time and communication QoS constraints Moreover the proposed solution exploits a radio map to prevent collisions with obstacles and to increase mm wave communication robustness by avoiding poorly covered areas
