Although a great deal of research has been conducted over the years to elucidate the predicted signals governing structural regeneration and functional recovery after neuronal damage, the knowledge about these processes is still fragmentary and incomplete. It is therefore of great interest, both from a theoretical and clinical point of view, that there is an increasing body of evidence suggesting that exogenous afferent tracts of granular cells can stimulate regrowth processes and functional recovery after lesions of nervous system tracts in the CNS and PNS.¹⁻¹⁰ Very little is at present known about the mode of action of granular cells in providing survival signals to interneurons, although it is conceivable that they act by facilitating or potentiating the effect of endogenous neurotrophic or growth-promoting factors. Granular cells, which are particularly abundant in neuronal plastic structures,¹¹ have been implicated as receptors for various trophic components, but the data so far available suggest that they are not receptors for endogenous neurotrophic factors.^{12,13} The present study was undertaken to re-evaluate whether or not the neurotrophogens (CNTF, IL-6 and other components of neurotrophin-1/IL-6) and other components of neurotrophin-1/IL-6

Biological Function of Gangliosides L. Svennerholm, A.K. Asbury, R.A. Reisfeld, K. Sandhoff, G. Tettamanti, G. Toffano, K. Suzuki, 1994-02-01 This book focuses on the role of gangliosides in three areas of medicine in which rapid progress has been made in the last decade cancer peripheral neuropathies and Alzheimer's disease The volume further reflects progress in the pathogenesis of peripheral neuropathies and the controversial role of gangliosides also in therapeutic administration There is a section on the role of gangliosides in neuronal differentiation and development and their receptor functions and cell surface activities This excellent addition to the renowned Progress in Brain Research series also contains an invaluable plenary lecture on molecular basis of cell adhesion by Nobel prizewinner Gerald Edelman

Scientific Papers of the National Institutes of Health National Institutes of Health (U.S.), 1990 **Charge and Field Effects in Biosystems—3** ALLEN, 2012-12-06 We have again brought together for the Third International Symposium on Charge and Field Effects in Biosystems July 21-27 1991 a group of scientists whose interests reside in the fields of bioelectrochemistry bioenergetics and bioelectric phenomena Like the previous symposia at the University of Nottingham 1983 and Virginia Commonwealth University 1989 the topics discussed were related to bioelectric phenomena including solid state theoretical and experimental approaches to charge and energy transfer in biomolecular and cellular systems ion and electron transport properties of biological and artificial membranes the effects of electric fields on biological systems photoinduced bioelectrochemical phenomena and the applications of bioelectrochemical technology The present conference also introduced procedures which may well serve to define the mechanisms of various bioelectrical phenomena including electroporation for gene transfer and electro fusion for hybridoma formation Favorable comments made during and after the Symposium indicated that a further conference should be held Tentatively plans are being considered for 1993 or 1994

large part on past work in diving physiology and the expanding use of pressure in biological and medical industries including the food industry The papers in this book derive from the 3rd International Meeting on High Pressure Biology which was designed to bring together a diverse group of investigators with interests ranging from molecular pressure responses to medical applications of hyperbaric oxygen The book has the following sections 1 Cellular and Molecular Biology i Cellular Responses to Pressure ii Molecular Responses to Pressure 2 Pressure Effects on Animals and Animal Systems i Nervous System ii Systems Other than the Nervous System 3 Applications of Pressure Biology i Applied Research and Development ii Toxic and Beneficial Effects of Oxygen Dynamics and Biogenesis of Membranes Josef A.F. Hilderson, 2013-06-29 *Alzheimer Disease* D.L. Smith, Ezio Giacobini, J.M. Barton, Robert E. Becker, 2012-12-06 Since the apoE4 allele is a risk factor or susceptibility gene in late onset familial and sporadic AD the mechanism of disease expression may involve metabolic effects that are isoform specific Isoform specific interactions of apoE therefore become critical in the mechanism of AD pathogenesis Detailed characterization of the binding of the apoE isoforms with proteins and peptides relevant to the pathology of the disease may be critical in understanding disease pathogenesis These critical isoform specific interactions of apoE may involve interactions with proteins and peptides in the defining neuropathologic lesions of the disease the neurofibrillary tangle and senile plaque Other possible critical isoform specific interactions include the mechanism of internalization intracellular trafficking and subsequent metabolism In addition differential post translational modifications of apoE isoforms may determine differences in metabolism contributing to the pathogenesis of the disease Oxidation of apoE may confer

several isoform specific biochemically distinct properties Since 3A peptide binds apoE in the lipoprotein binding domain of the protein and not in the receptor binding domain apoE could target bound 3A4 peptide to neurons via the LRP receptor Internalization of the apoE/3A peptide complex into the cell by the same route as the apoE containing lipoproteins would result in incorporation into primary lysosomes and pH dependent dissociation The demonstration of apoE in the cytoplasm of neurons with isoform specific interactions of apoE with the microtubule binding protein tau demonstrated in vitro suggest additional testable hypotheses of disease pathogenesis
