FEATURES

The ABS ensures directional stability and controllability during hard braking.

For vehicles with this type of ABS, 4 sensors (4 channels) are installed on front and rear wheels allowing independent left and right control.

The system has the following features:

- EBD (Electronic Brake-force Distribution system) control has been added to provide the ideal braking force for the rear wheels.
- Magnetic encoder for wheel speed detection has been installed as a sensing device instead of the rotor.
- For wiring harness saving and secure data communication, CAN[™] bus has been adopted as a tool of communication with another ECU.

NOTE: [™]: For more information about CAN (Controller Area Network), refer to Group 54C, General Information P.54C-2.

EBD CONTROL

In ABS, electronic control is used so the rear wheel brake hydraulic pressure during braking is regulated by rear wheel control solenoid valves in accordance with the vehicle's rate of deceleration, and the front and rear wheel slippage which are calculated from the signals received from the various wheel speed sensors. EBD control provides a high level of control for both vehicle braking force and vehicle stability.

The system has the following features:

- Because the system provides the optimum rear wheel braking force regardless of vehicle load condition and the condition of the road surface, the system reduces the required pedal depression force, particularly when the vehicle is heavily loaded or driven on road surfaces with high frictional coefficients.
- Because the duty placed on the front brakes is reduced, the increase in pad temperature can be controlled during brakes application to improve the wear resistance characteristics of the pad.
- Control valves such as the proportioning valve are not required.
