

Biomechanics and Motor Control

Defining Central Concepts

Mark L. Latash and Vladimir M. Zatsiorsky

The fields of biomechanics of human motion and motor control have developed rapidly, with research published in biology, psychology, physics, medicine, physical therapy, robotics, and engineering. Scientists in these different disciplines have coined new terms with imprecise or varying meanings. This confusion in meaning has hindered the advancement of the science. *Biomechanics and Motor Control: Defining Central Concepts* clarifies the meaning of the most frequently used terms.

The book consists of four parts. Part I covers biomechanical concepts. It includes joint torques, stiffness and stiffness-like measures, viscosity, damping and impedance, and mechanical work and energy. Part II deals with neurophysiological concepts used in motor control, such as muscle tone, reflex, preprogrammed reactions, efferent copy, and central pattern generator. Part III concentrates on central motor control concepts. They include redundancy and abundance, synergy, equilibrium-point hypothesis, and motor program. Part IV includes posture and prehension from the field of motor behavior. The book is organized to cover smaller concepts within the context of larger concepts. For example, internal models are covered in the chapter on motor programs. Major concepts are not only defined but given context as to how research came to use the term in this manner. There is thus a chapter on each major concept, with a glossary at the end of the book providing a more traditional brief definition of each term.

Key Features:

- Organizes key concepts by field
- Features concepts from biomechanics, neurophysiology, motor control, and motor behavior
- Provides a research context for each major concept
- Includes an alphabetical glossary for brief definitions
- Assists researchers in better communicating their findings for adjacent fields

must read for physical therapists and occupational therapists at all levels who seek the best assessment and treatment outcomes for neurologically impaired individuals Human Robotics Etienne Burdet, David W. Franklin, Theodore E. Milner, 2018-05-04 A synthesis of biomechanics and neural control that draws on recent advances in robotics to address control problems solved by the human sensorimotor system This book proposes a transdisciplinary approach to investigating human motor control that synthesizes musculoskeletal biomechanics and neural control The authors argue that this integrated approach which uses the framework of robotics to understand sensorimotor control problems offers a more complete and accurate description than either a purely neural computational approach or a purely biomechanical one The authors offer an account of motor control in which explanatory models are based on experimental evidence using mathematical approaches reminiscent of physics These computational models yield algorithms for motor control that may be used as tools to investigate or treat diseases of the sensorimotor system and to guide the development of algorithms and hardware that can be incorporated into products designed to assist with the tasks of daily living The authors focus on the insights their approach offers in understanding how movement of the arm is controlled and how the control adapts to changing environments The book begins with muscle mechanics and control progresses in a logical manner to planning and behavior and describes applications in neurorehabilitation and robotics The material is self contained and accessible to researchers and professionals in a range of fields including psychology kinesiology neurology computer science and robotics
