

Mendelian Genetics

- Genes - code for proteins
 - Each normal sperm and egg contains a recipe for building a living organism
 - NOT a "blueprint" as is often said
- Prokaryotes such as bacteria typically contain a single circular bacteria chromosome
- Eukaryotes contain multiple linear chromosomes
 - Chromosome numbers do not necessarily correlate to the genetic complexity
 - Humans have 46 chromosomes
 - A fern has 1260
- Gene mutation creates genetic diversity
 - Copying and transmitting genes from one generation to the next increases genetic variation
 - Mutations occur during copying and lead to different alleles
 - Can be beneficial, neutral, or dysfunctional
- Segregation and independent assortment create gamete diversity
 - Both parents make a contribution, but not 100% contribution
 - While they only contribute half of the genetic information, they give out a complete copy of the "recipe book"
 - 23 "pages" from mom and 23 "pages" from dad
 - During meiosis the separation of pairs of alleles is known as segregation
 - Why siblings are not identical (besides identical twins)
- independent assortment → genes are (mostly) inherited independently of each other
- Segregation dictates that alleles will have a 50% chance of ending up in a gamete (sperm or egg)
 - 23 chromosome pairs
 - = 8,000,000 possible unique gametes
 - Those gametes undergo random fertilization this means that gamete will fertilize no matter what alleles they contain
 - 1/64,000,000

The Inheritance of traits

- Gregor Mendel (1822)
 - Grew 30,000 pea plants and documented the inheritance of their traits after transplanting pollen
 - Had no idea about genes but his experiments were sound and rigorous
 - Genotype - the genetic composition of the organism (physical genes and their codes)
 - A, G, T, C
 - Phenotype - physical traits prescribes for those genes (can see with the naked eye)
