Nanomanufacturing Handbook Nanomanufacturing Handbook:

Nanomanufacturing Handbook Ahmed Busnaina, 2017-12-19 Breakthroughs in nanotechnology have been coming at a rapid pace over the past few years. This was fueled by significant worldwide investments by governments and industry. But if these promising young technologies cannot begin to show commercial viability soon, that funding is in danger of disappearing as investors lose their appetites and the economic and scientific promise of nanotechnology may not be realized. Scrutinizing the barriers to commercial scale up of nanotechnologies, the *Nanomanufacturing Handbook* presents a broad survey of the research being done to bring nanotechnology out of the laboratory and into the factory. Current research into nanotechnology focuses on the underlying science, but as this forward-looking handbook points out, the immediate need is for research into scale-up, process robustness, and system integration issues. Taking that message to heart, this book collects cutting-edge research from top experts who examine such topics as surface-programmed assembly, fabrication and applications of single-walled carbon nanotubes (SWNTs), including nanoelectronics, manufacturing nanoelectrical contacts, room-temperature nanoimprint and nanocontact technologies, nanocontacts and switch reliability, defects and surface preparation, and other innovative application-driven initiatives. In addition to these technical issues, the author provides a survey of the current state of nanomanufacturing in the United States, the first of its kind, and coverage also reaches into patenting nanotechnologies as well as regulatory and societal issues. With timely authoritative coverage accompanied by numerous illustrations, the *Nanomanufacturing Handbook* clarifies the current challenges facing industrial-scale nanotechnologies and outlines advanced tools and strategies that will help overcome them. *Handbook of Nanofabrication*, 2010-05-25 Many of the devices and systems used in modern industry are becoming progressively smaller and have reached the nanoscale domain. Nanofabrication aims at building nanoscale structures which can act as components, devices, or systems in large quantities at potentially low cost. Nanofabrication is vital to all nanotechnology fields, especially for the realization of nanotechnology that involves the traditional areas across engineering and science. Includes chapters covering the most important Nanofabrication techniques which aid comprehensive understanding of the latest manufacturing technologies encountered in the field of nano-level manufacturing, which is essential for preparing for advanced study and application in nanofabrication techniques by enabling thorough understanding of the entire nanofabrication process as it applies to advanced electronic and related manufacturing technologies. Each chapter covers a nanofabrication technique comprehensively, which allows the reader to learn to produce nanometer-level products as well as collect process and analyze data, improve process parameters, and how to assist engineers in research, development, and manufacture of the same. Includes contributions from recognized experts from around the globe, making the reader aware of variations in similar techniques applied in different geographical locations and is better positioned to establish all possible global applications. **Springer Handbook of Nanotechnology** Bharat Bhushan, 2004-01-19 This major work has established itself as the definitive reference in the nanoscience and nanotechnology.

building the dependence of the structure and shape of the nanoelements forming the basis for the composite of their sizes. This is because with an increase or a decrease in the specific size of nanoelements their physical mechanical properties such as the coefficient of elasticity strength and deformation parameter vary by over one order. The calculations show that this is primarily due to a significant rearrangement of the atomic structure and the shape of the nanoelement. The investigation of the above parameters of the nanoelements is technically complicated and laborious because of their small sizes. When the characteristics of powder nanocomposites are calculated it is also very important to take into account the interaction of the nanoelements since the changes in their original shapes and sizes in the interaction process and during the formation of the nanocomposite can lead to a significant change in its properties and a cardinal structural rearrangement. In addition the studies show the appearance of the processes of the ordering and self assembling leading to a more organized form of a nanosystem. The above phenomena play an important role in nanotechnological processes. They allow nanotechnologies to be developed for the formation of nanostructures by the self assembling method which is based on self organizing processes and building up complex spatial nanostructures consisting of different nanoelements. The study of the above dependences based on the mathematical modeling methods requires the solution of the aforementioned problem at the atomic level. This requires large computational aids and computational time which makes the development of economical calculation methods urgent. The objective of this volume is the development of such a technique in various nanosystems.
