## **Nanoscale Inorganic Macroions In Solution Nanostructure Science And Technology:**

*Nanoscale Assembly* Wilhelm T.S. Huck, 2006-07-11 Nanotechnology has received tremendous interest over the last decade not only from the scientific community but also from a business perspective and from the general public. Although nanotechnology is still at the largely unexplored frontier of science, it has the potential for extremely exciting technological innovations that will have an enormous impact on areas as diverse as information technology, medicine, energy, supply, and probably many others. The miniaturization of devices and structures will impact the speed of devices and information storage capacity. More importantly, though, nanotechnology should lead to completely new functional devices as nanostructures have fundamentally different physical properties that are governed by quantum effects. When nanometer sized features are fabricated in materials that are currently used in electronic, magnetic, and optical applications, quantum behavior will lead to a set of unprecedented properties. The interactions of nanostructures with biological materials are largely unexplored. Future work in this direction should yield enabling technologies that allow the study and direct manipulation of biological processes at the sub-cellular level. *Nanoscale structure and assembly at solid-fluid interfaces* Xiang Yang Liu, Jim De Yoreo, 2004

*Nanoscale Structure and Assembly at Solid-fluid Interfaces* Jim De Yoreo, Xiang Yang Liu, 2004      **Nanoscale Materials in Chemistry** Kenneth J. Klabunde, 2015-11-16 *Nanoscale Materials in Chemistry*      Solution Behaviors of Macroions Driven by Non-covalent Interactions Yunyi Gao, 2018 Macroions demonstrate very intriguing solution behaviors that are different from colloids and simple ions due to their intermediate sizes in between. Those macroions when carrying moderate surface charge density can self-assemble into a spherical hollow single-layered blackberry structures in solution with counterion-mediated attraction to be the major driving force. Other non-covalent forces such as hydrogen bonding and solvophobic interactions are also playing a significant role in directing the solution behaviors of macroions. In this dissertation, uranyl peroxide nanoclusters are investigated to further explore and expand their unique solution properties as macroions. These U60 clusters were proved to be able to distinguish different monovalent counterions and only allow certain counterions to be trapped inside their cages. The hydration shell destruction was dominantly contributing to the entropy loss during the ion binding process. Such ion selectivity properties can be accurately tuned by changing the incubating temperature of the aqueous environment. The U24Pp12 clusters when synthesized with different counterions showed two isomeric structures depending on the orientation of one of the polyhedral faces. The transition from a concave out to a concave in structure was made possible by simply titrating the monovalent counterions into the U24Pp12 solutions. The non-covalently linked surfactant encapsulated nanoclusters of U60 and different cationic surfactants were found to be able to self-assemble into vesicle-like structures mimicking the self-assembly of those covalently linked POM inorganic hybrids. The self-assembly and structural transition behaviors are mainly characterized by dynamic light scattering (DLS), static light scattering (SLS), and isothermal titration calorimetry (ITC).      **Synthesis and Applications of Inorganic Nanostructures** Huaqiang

The Chemistry Of Nanostructured Materials Peidong Yang,2003-12-23 This important book reviews extensively the preparative chemistry of various

nanostructured materials as well as structural property correlations for these new materials Materials of current interest such as nanocrystals nanowires nanotubes porous materials and composites are comprehensively covered

*Functionalized Nanoscale Materials, Devices and Systems* Ashok K. Vaseashta,Ion N. Mihailescu,2010-11-16 The primary objective of the NATO Advanced Study Institute ASI titled Functionalized Nanoscale Materials Devices and Systems for Chem Bio Sensors Photonics and Energy Generation and Storage was to present a contemporary and comprehensive overview of the field of nanostructured materials and devices and its applications in chem bio sensors nanophotonics and energy generation and storage devices The study has become one of the most promising disciplines in science and technology as it aims at the

fundamental understanding of new physical chemical and biological properties of systems and the technological advances arising from their exploration. Such systems are intermediate in size between the isolated atoms and molecules and bulk material where the unique transitional characteristics between the two can be understood, controlled, and manipulated. Nanotechnologies refer to the creation and utilization of functional materials, devices, and systems with novel properties and functions that are achieved through the control of matter atom by atom, molecule by molecule, or at a molecular level. Advances made over the last few years provide new opportunities for scientific and technological developments in nanostructures and nanosystems with new architectures with improved functionality. The field is very active and rapidly evolving and covers a wide range of disciplines. Recently, various nanoscale materials, devices, and systems with remarkable properties have been developed with numerous unique applications in chemical and biological sensors, nanophotonics, nanobiotechnology, and in vivo analysis of cellular processes at the nanoscale. **Nanoscale Materials in Chemistry**, 2011

*Inorganic Particle Synthesis Via Macro and Microemulsions* Dibyendu Ganguli, Munia Ganguli, 2003-10-01

*Understanding the Non-covalent Interactions in Macroions and Hybrid Macromolecules* Jing Zhou, 2015. Self-assembly is known as a route to achieve order from disorder at various length scales ubiquitously in nature, science, and technology. Noncovalent interactions such as electrostatic interactions, hydrophobic interactions, metal coordination, and hydrogen bonding have been utilized extensively in past decades to build and control macromolecular self-assemblies. Hydrophilic macroions with sizes ranging between simple ions and point charges, valid for the Debye-Hückel Theory and colloidal suspensions usually described by the DLVO theory, demonstrate unique solution behavior by self-assembling into ordered single layer, hollow spherical, blackberry structures. Counterion-mediated attraction is considered as the main driving force for the self-assembly behavior. Herein, we investigated the solution behavior of ionic polyhedral oligomeric silsesquioxane (POSS) and cyclodextrin (CD) which have well-defined size, shape, and charge density by laser light scattering (LLS). Sub-nanometer sized ionic POSS provides a valuable opportunity to explore the unknown size boundary between simple ions and macroions. Whereas studying ionic CD, a fully organic macroion, expands our understanding beyond inorganic macroion. Macroion polymer-based giant surfactant with smart responsiveness was designed and fabricated. The novel hybrid can self-assemble in pure water and respond to temperature and salt stimuli. We found that different types of counterions impact the vesicle formation at room temperature. The development of such stimulative vesicles provides new and useful means for catalytic and biomedical applications.
