transformed into musculoskeletal physiotherapy and this is recognized by the change in title for the new edition Grieve's Modern Musculoskeletal Physiotherapy. The topics addressed and the contributing authors reflect the best and most clinically relevant contemporary work within the field of musculoskeletal physiotherapy. With this as its foundation and a new six strong editorial team at its helm the fourth edition now expands its focus from the vertebral column to the entire musculoskeletal system. For the first time both the spine and extremities are covered capturing the key advances in science and practices relevant to musculoskeletal physiotherapy. The book is divided into five parts containing multiple sections and chapters. The first part looks at advances in the sciences underpinning musculoskeletal physiotherapy practice. Here there is commentary on topics such as movement the interaction between pain and motor control as well as neuromuscular adaptations to exercise. Applied anatomical structure is covered in addition to the challenges of lifestyle and ageing. A new section highlights the important area of measurement and presents the scope of current and emerging measurements for investigating central and peripheral aspects relating to pain function and morphological change. Another section discusses some contemporary research approaches such as quantitative and qualitative methods as well as translational research. Part III contains sections on the principles of and broader aspects of management which are applicable to musculoskeletal disorders of both the spine and periphery. Topics include models for management prescription communication and pain management and contemporary principles of management for the articular nervous and sensorimotor systems. In recognition of the patient centred and inclusive nature of contemporary musculoskeletal practice there is also discussion about how physiotherapists may use cognitive behavioural therapies when treating people with chronic musculoskeletal disorders. The final part of the book focuses on selected contemporary issues in clinical practice for a particular region condition or the most topical approaches to the diagnosis and management of a region. A critical review of the evidence or developing evidence for approaches is given and areas for future work are highlighted. Presents state of the art manual therapy research from the last 10 years. This book proposes a didactic approach to the different aspects of pain in mental health The various chapters cover the myths neurophysiology perception measurement and management of pain in mental health The most common problems including mood disorders schizophrenia anxiety somatoform disorders and pervasive developmental disorders are covered Each chapter addresses the problem of pain by putting an emphasis on the characteristics of different populations of patients suffering from mental illness The book helps specialists working in different areas of mental health to appreciate the importance of pain problems in mental health and also offers avenues for the measurement and treatment of pain in these patients Mental health and pain are complex issues They also share certain mutually influential neurophysiological mechanisms which makes it even more difficult to identify their specific individual characteristics This duality between the somatic and psychic components can become a pitfall for the specialist in mental health since it can be difficult to disentangle the evolution of a painful condition from the mental illness      **Braddom's**
