Pathogenic mechanism of porcine viral disease Mengmeng Zhao,Lingxue Yu ,Weili Kong,Xuelian Zhang,2024-09-30 Swine virus diseases pose a significant threat to the pig industry due to their highly contagious nature and ability to cause immense harm Once a pig is infected the risk extends to the entire farm or even a larger area In recent years there has been an emergence and re emergence of disease pathogens that have been able to overcome existing immune defense mechanisms through continuous recombination and evolution As a result current immune prevention and control measures have become ineffective Notable examples of these diseases include African swine fever virus ASFV porcine reproductive and respiratory syndrome virus PRRSV porcine epidemic diarrhea virus PEDV and porcine

pseudorabies virus PRV These viruses constantly mutate under various selection pressures including immunity within the host body and vaccine induced immunity Furthermore with the increase in international trade the spread of these viruses has become more rapid and extensive Moreover it is worth noting that similar virus strains originating from different regions have the potential to undergo recombination resulting in the emergence of recombinant mutant strains These mutant strains can pose a challenge to existing immune prevention and control measures thereby adding complexity to the ongoing efforts in disease prevention and control *Cumulated Index Medicus* ,1994 **Insights In Biosafety & Biosecurity**
