

Chapter 3: Consumer Behavior

- c. Suppose instead that pizza is rationed at a quantity less than Ben's desired quantity. Illustrate Ben's new optimal bundle.

Rationing the quantity of pizza that can be purchased will result in Ben not being able to choose his optimal bundle. He will have to choose a bundle on the budget line that is above his original bundle. This new bundle will have a lower level of utility.

13. Brenda wants to buy a new car and has a budget of \$25,000. She has just found a magazine that assigns each car an index for styling and an index for gas mileage. Each index runs from 1-10, with 10 representing either the most styling or the best gas mileage.

While looking at the list of cars, Brenda observes that on average, as the style index rises by one unit, the price of the car increases by \$5,000. She also observes that as the gas mileage index rises by one unit, the price of the car increases by \$2,500.

- a. Illustrate the various combinations of style (S) and gas mileage (G) that Brenda could select with her \$25,000 budget. Place gas mileage on the horizontal axis.

For every \$5,000 she spends on style the index rises by one so the most she can achieve is a car with a style index of 5. For every \$2,500 she spends on gas mileage, the index rises by one so the most she can achieve is a car with a gas mileage index of 10. The slope of her "budget line" is $-1/2$.

- b. Suppose Brenda's preferences are such that she always receives three times as much satisfaction from an extra unit of styling as she does from gas mileage. What type of car will Brenda choose?

If Brenda always receives three times as much satisfaction from an extra unit of styling then she is willing to trade one unit of styling for three units of gas mileage, and still maintain the same level of satisfaction. This is her MRS or the slope of her indifference curves, which is constant. Since the MRS is $1/3$ and the slope of her budget line is $-1/2$, Brenda will choose all styling. You can also compute the marginal utility per dollar for styling and gas mileage and note that styling will be higher. In the graph below, she will move up to the highest possible indifference curve where she chooses all styling and no gas mileage.

Burkett, 2006-04-20 In this book John P Burkett presents microeconomics as an evolving science interacting with mathematics psychology and other disciplines and offering solutions to a growing range of practical problems The book shows how early contributors such as

Xenophon Ibn Khaldun and David Hume posed the normative and positive questions central to microeconomics. It expounds constrained optimization techniques as developed by economists and mathematicians from Daniel Bernoulli to Leonid Kantorovich, emphasizing their value in deriving norms of rational behavior and testable hypotheses about typical behavior. Applying these techniques, the book introduces partial equilibrium analysis of particular markets and general equilibrium analysis of market economies. The book both explains how laboratory and field experiments are used in testing economic hypotheses and provides materials for classroom experiments. It gives extensive and innovative coverage of recent findings in cognitive psychology and behavioral economics, which not only document behavior inconsistent with some traditional theories but also advance positive theories with superior predictive power. Modeling Techniques in Predictive Analytics Thomas W. Miller, 2015 Now fully updated, this uniquely accessible book will help you use predictive analytics to solve real business problems and drive real competitive advantage. If you're new to the discipline, it will give you the strong foundation you need to get accurate, actionable results. If you're already a modeler, programmer, or manager, it will teach you crucial skills you don't yet have. This guide illuminates the discipline through realistic vignettes and intuitive data visualizations, not complex math. Thomas W. Miller, leader of Northwestern University's pioneering program in predictive analytics, guides you through defining problems, identifying data, crafting and optimizing models, writing effective R code, interpreting results, and more. Every chapter focuses on one of today's key applications for predictive analytics, delivering skills and knowledge to put models to work and maximize their value. Reflecting extensive student and instructor feedback, this edition adds five classroom-tested case studies, updates all code for new versions of R, explains code behavior more clearly and completely, and covers modern data science methods even more effectively. **Behavioral Economics** Floris Heukelom, 2014-02-17 The book discusses the theories, theorists, and contexts from which behavioral economics arose and shows how this new field in economics subsequently developed. The central theme running through the book is that behavioral economics reflects and contributes to a fundamental reorientation of the foundations upon which economics was based for nearly two hundred years.

Robert S. Pindyck, Daniel L. Rubinfeld, 2013 **The Next Generation of Electric Power Unit Commitment Models**

Benjamin F. Hobbs, Michael H. Rothkopf, Richard P. O'Neill, Hung-po Chao, 2006-04-11 Over the years the electric power industry has been using optimization methods to help them solve the unit commitment problem. The result has been savings of tens and perhaps hundreds of millions of dollars in fuel costs. Things are changing, however. Optimization technology is improving and the industry is undergoing radical restructuring. Consequently, the role of commitment models is changing and the value of the improved solutions that better algorithms might yield is increasing. The dual purpose of this book is to explore the technology and needs of the next generation of computer models for aiding unit commitment decisions. Because of the unit commitment problem's size and complexity and because of the large economic benefits that could result from its improved solution, considerable attention has been devoted to algorithm development in the book. More systematic procedures based on a variety of widely researched algorithms have been proposed and tested. These techniques have included dynamic programming, branch and bound, mixed integer programming, MIP, linear and network programming approaches, and Benders decomposition methods among others. Recently, metaheuristic methods have been tested, such as genetic programming and simulated annealing, along with expert systems and neural networks. Because electric markets are changing rapidly, how UC models are solved and what purposes they serve need reconsideration. Hence, the book brings together people who understand the problem and people who know what improvements in algorithms are really possible. The two-fold result in *The Next Generation of Electric Power Unit Commitment Models* is an assessment of industry needs and new formulations and computational approaches that promise to make unit commitment models more responsive to those needs.
