Micrnas Key Regulators Of Oncogenesis:

MicroRNAs: Key Regulators of Oncogenesis Sadegh Babashah, 2014-07-08 Aberrant expression and function of microRNAs miRNAs in cancer have added a new layer of complexity to the understanding of development and progression of the disease state It has been demonstrated that miRNAs have a crucial function in oncogenesis by regulating cell proliferation and apoptosis as oncogenes or tumor suppressors The expression signatures of miRNAs provide exciting opportunities in the diagnosis prognosis and therapy of cancer Since miRNAs can function as either oncogenes or tumor suppressor genes in oncogenesis the potential of using these small RNAs as therapeutic targets opens up new opportunities for cancer therapy by either inhibiting or augmenting their activity

Alterations of Epigenetics and MicroRNAs in Cancer and Cancer Stem Cell Yoshimasa Saito,2014-11-10 Studies have shown that alterations of epigenetics and microRNAs miRNAs play critical roles in the initiation and progression of human cancer Epigenetic silencing of tumor suppressor genes in cancer cells is generally mediated by DNA

hypermethylation of CpG island promoter and histone modification such as methylation of histone H3 lysine 9 H3K9 and tri methylation of H3K27 MiRNAs are small non coding RNAs that regulate expression of various target genes Specific miRNAs are aberrantly expressed and play roles as tumor suppressors or oncogenes during carcinogenesis Important tumor suppressor miRNAs are silenced by epigenetic alterations resulting in activation of target oncogenes in human malignancies Stem cells have the ability to perpetuate themselves through self renewal and to generate mature cells of various tissues through differentiation Accumulating evidence suggests that a subpopulation of cancer cells with distinct stem like properties is responsible for tumor initiation invasive growth and metastasis formation which is defined as cancer stem cells Cancer stem cells are considered to be resistant to conventional chemotherapy and radiation therapy suggesting that these cells are important targets of cancer therapy DNA methylation histone modification and miRNAs may be deeply involved in stem like properties in cancer cells Restoring the expression of tumor suppressor genes and miRNAs by chromatin modifying drugs may be a promising therapeutic approach for cancer stem cells In this Research Topic we discuss about alterations of epigenetics and miRNAs in cancer and cancer stem cell and understand the molecular mechanism underlying the formation of cancer stem cell which may provide a novel insight for treatment of refractory cancer
