Kane, Frederick R. Taylor, Minnesota Evidence-based Practice Center, 2013 **OBJECTIVES** To assess comparative effectiveness and safety of preventive pharmacologic treatments for community dwelling adults with episodic or chronic migraine **DATA SOURCES** We searched major electronic bibliographic databases and trial registries up to May 20 2012 **REVIEW METHODS** We performed a systematic review of published English language original studies of pharmacologic treatments for prevention of episodic or chronic migraine Studies that compared drugs with inactive controls nonpharmacologic interventions or other drugs were eligible Outcomes evaluated included rates of complete migraine cessation  $\geq 50$  percent reduction in monthly migraine frequency reduction in migraine related disability and improvement in quality of life We calculated absolute risk differences pooled them with random effects models and with Bayesian network meta analysis and calculated numbers of outcome events attributable to treatments per 1 000 participants treated **RESULTS** Of 5 244 retrieved references 245 publications of randomized controlled clinical trials RCTs and 76 publications of nonrandomized therapeutic studies met eligibility criteria Most enrollees were middle aged Caucasian women with an average of five monthly migraine attacks Few trials reported the proportion of obese subjects but many subjects were overweight More than half of the RCTs defined migraine according to the International Headache Society criteria Studies excluded adults with severe medical or psychiatric illnesses or contraindications to examined drugs Strength of evidence was mostly low due to risk of bias and imprecision in individual RCTs and pooled estimates For chronic migraine botulinum toxin formulations were examined in 20 RCTs of 4 237 adults Onabotulinumtoxin A was more effective than placebo in reducing monthly chronic migraine attacks by  $\geq 50$  percent low strength evidence from 3 RCTs of 459 adults with inconsistent improvement in quality of life Pooled analyses demonstrated that per 1 000 treated adults 170 95% confidence interval CI 82

to 258 would experience e50 percent reduction in migraine frequency 155 95% CI 90 to 220 would experience adverse effects and 26 95% CI 10 to 43 would discontinue treatments due to bothersome adverse effects Topiramate reduced disability in patients with chronic migraine but failed to decrease monthly migraine frequency by e50 percent low strength evidence from one RCT of 328 adults Individual RCTs examined the comparative effectiveness of onabotulinumtoxin A with topiramate or divalproex and found no differences in chronic migraine prevention Propranolol combined with topiramate treatment demonstrated no benefits in nonresponders to topiramate monotherapy low strength evidence from one RCT of 191 adults For episodic migraine RCTs examined 59 drugs from 14 drug classes All approved drugs topiramate divalproex timolol and propranolol some off label beta blockers ACE inhibitors and the angiotensin II receptor antagonist candesartan were better than placebo in reducing episodic monthly migraine frequency by e50 percent Drugs would result in clinical improvement in 200 to 400 patients per 1 000 treated Adverse effects leading to treatment discontinuation were examined in 68 RCTs Topiramate off label antiepileptics and antidepressants resulted in bothersome adverse effects leading to treatment discontinuation more often than placebo Limited direct evidence of comparative effectiveness from head to head RCTs demonstrated no consistent significant differences in outcomes with examined drugs in patients with episodic migraine Exploratory indirect adjusted frequentist analysis offered low strength evidence that the angiotensin II receptor blocker candesartan was more effective than approved drugs including topiramate propranolol timolol and divalproex Exploratory network Bayesian meta analysis offered low strength evidence that angiotensin inhibiting drugs captopril lisinopril candesartan were the most effective and tolerable for episodic migraine prevention in adults who have no contraindications to examined drugs Individual RCTs of drug management interventions for episodic migraine offered low strength evidence that compared with usual care multidisciplinary team care improved quality of life and reduced migraine related disability a headache management program resulted in complete cessation of migraine a minimal contact cognitive behavioral program improved patient satisfaction with treatments headache school decreased overuse of drugs for acute headache attacks and reduced migraine disability pharmaceutical care improved self efficacy and an intensive pharmaceutical care campaign had no statistically significant impact on use of acute drugs CONCLUSIONS For chronic migraine onabotulinumtoxin A reduced migraine attacks but increased the risk of adverse effects and treatment discontinuation due to adverse effects For episodic migraine approved drugs are effective but increase risk of adverse effects and treatment discontinuation due to adverse effects Some off label beta blockers and angiotensin inhibiting drugs are effective without bothersome harms and therefore offer the best benefits to harms ratio We could not determine the long term i e trials of more than 3 months duration preventive benefits and adherence with drugs Evidence on improving quality of life was inconsistent across individual drugs Evidence for individualized treatment decisions is very limited Future research should examine the role of patient characteristics on drug benefits and safety
