Objects on a Ramp

Another type of problem is an object on a ramp or tilted table. The normal force is still perpendicular to the table, but gravity is always pointing straight down.

Gravity can be decomposed into its x- and y-components (relative to the ramp), as shown below. Because of Newton's third law, we know that $N = mg \cos \theta$.

Friction force is always in the opposite direction of motion. In the ramp example, gravity pulls the object down the ramp, so friction acts in the opposite direction (up the ramp), impeding the object's motion.

- There are two friction coefficients: the coefficient of static friction (μ_s) and the coefficient of kinetic friction (μ_k). The static coefficient is always greater than the kinetic coefficient, which is why it takes less force to keep an object sliding along the ground than it does to make it start moving. The graph below shows the magnitude of the friction force over time while resisting an external force.

- $\mu_s F$ is the static friction the block needs to overcome before it can move.
- If the block is not moving, we can calculate the magnitude of static friction.
- If the block is moving, we can calculate the magnitude of kinetic friction.

Springs

If an object is attached to a spring (or another spring) the force provided by the spring is called **spring**. This could be an object hanging from a spring or an object being pulled by a spring.

- Whether the spring is described as being to move, this means that we can describe the spring with perfectly elastic energy from one end of the spring to the other.
- The mass itself is a constant spring, most things are like this. This means that every point along the spring has the same mass and elastic energy.
- If the spring is rigid, then we can decompose the tension force into components.
