

An aerial photograph of a tropical rainforest with a prominent, winding river. The river flows from the bottom left towards the top right, meandering through dense green forest. The water in the river is a deep blue, contrasting with the vibrant green of the trees. In the background, the river eventually meets a larger body of water, possibly the ocean, under a cloudy sky.

## **Origin And Evolution Of Tropical Rain Forests:**

*Origin and Evolution of Tropical Rain Forests* Robert J. Morley, 2000-04-07 Although tropical rain forests form the world's most species rich ecosystems their origin and history remain unclear except on the very short timescale of the last 40 000 years or so This book provides the first comprehensive review of the history of tropical rain forests on a long term geological timescale commencing with the origin of the angiosperms over 100 million years ago which today overwhelmingly dominate these forests Tropical rain forest evolution is discussed in a global context within an up to date plate tectonic palaeogeographical and palaeoclimatic framework primarily by reference to the record of fossil pollen and spores A particularly important aspect of this book is that in addition to published literature it relies heavily on unpublished palynological data generated for petroleum companies during the course of hydrocarbon exploration programmes Without access to such data the book could not have been written The main text of the book reviews the evolution of tropical rain forests on a continent by continent basis culminating with a global synthesis of their history in relation to the changing positions of the world's tectonic plates and changing climates This section also establishes the age of the great tropical rain forest blocks and identifies the world's oldest tropical rain forests The final chapter compares 20th Century tropical rain forest destruction with prehistoric forest clearance in temperate regions and looks for analogues of the present phase of destruction within the geological record before considering long term implications of total rain forest destruction The book will be of interest to all concerned with tropical rain forests especially biologists botanists ecologists and students of evolution It will be valuable for postgraduates and advanced undergraduates as well as stratigraphers palaeobotanists palynologists and petroleum geologists [Tropical Rainforest Responses to Climatic Change](#) John Flenley, Mark

Bush, 2007-06-20 The goal of this book is to provide a current overview of the impacts of climate change on tropical forests to investigate past present and future climatic influences on the ecosystems with the highest biodiversity on the planet *Tropical Rainforest Responses to Climatic Change* will be the first book to examine how tropical rain forest ecology is altered by climate change rather than simply seeing how plant communities were altered Shifting the emphasis onto ecological processes e.g. how diversity is structured by climate and the subsequent impact on tropical forest ecology provides the reader with a more comprehensive coverage A major theme of this book that emerges progressively is the interaction between humans climate and forest ecology While numerous books have appeared dealing with forest fragmentation and conservation none have explicitly explored the long term occupation of tropical systems the influence of fire and the future climatic effects of deforestation coupled with anthropogenic emissions Incorporating modelling of past and future systems paves the way for a discussion of conservation from a climatic perspective rather than the usual plea to stop logging **Tropical Rain Forest Ecology, Diversity, and Conservation** Jaboury Ghazoul, Douglas Sheil, 2024-03-14 Rain forests represent the world's richest repository of terrestrial biodiversity and play a major role in regulating the global climate They support the livelihoods of a

substantial proportion of the world's population and are the source of many internationally traded commodities. They remain despite decades of conservation attention increasingly vulnerable to degradation and clearance with profound though often uncertain future costs to global society. Understanding the ecology of these diverse biomes and peoples' dependencies on them is fundamental to their future management and conservation.

**Tropical Rain Forest Ecology: Diversity and Conservation** introduces and explores what rain forests are, how they arose, what they contain, how they function, and how humans use and impact them. The book starts by introducing the variety of rain forest plants, fungi, microorganisms, and animals, emphasising the spectacular diversity that is the motivation for their conservation. The central chapters describe the origins of rain forest communities, the variety of rain forest formations, and their ecology and dynamics. The challenge of explaining the species richness of rain forest communities lies at the heart of ecological theory and forms a common theme throughout. The book's final section considers historical and current interactions of humans and rain forests. It explores biodiversity conservation as well as livelihood security for the many communities that are dependent on rain forests, inextricable issues that represent urgent priorities for scientists, conservationists, and policy makers.

**Earth System: History and Natural Variability - Volume III** Vaclav Cilek, 2009-07-15. Earth System History and Natural Variability theme is a component of Encyclopedia of Natural Resources Policy and Management in the global Encyclopedia of Life Support Systems (EOLSS) which is an integrated compendium of twenty-one Encyclopedias. The Theme on Earth System History and Natural Variability, with contributions from distinguished experts in the field, presents a description of the cosmic environment around our planet influencing the Earth in a number of ways through variation of solar energy or meteorite impacts. The structure of the Earth and its rocks, waters, and atmosphere is described. The Theme focuses on geological and evolutionary processes through the history of Earth's epochs and biomes since the Early Earth to the Quaternary. The unifying processes between the Earth's life and its rocks, waters, and atmosphere are global natural cycles of carbon, sulfur, and other elements that connect and influence the rate of geological processes, climate change, biological evolution, and human economy. These five volumes are aimed at the following five major target audiences: University and College students, Educators, Professional practitioners, Research personnel, and Policy analysts, managers, and decision makers, and NGOs.

**Origin of Tropical Diversity: From Clades to Communities** James Edward Richardson, R. Toby Pennington, 2017-01-12. In this volume, we aimed to assess progress in determining the processes by which current patterns of tropical biodiversity were established and are maintained. Tropical regions are highly species-rich, and we present studies that have improved our understanding of the generation of that diversity at local, regional, and global scales. We demonstrate how diverse fields from molecular phylogenetics, phylogeography, palaeontology, and palaeoecology continue to improve our understanding of the natural history of the tropics.

**Forests: A Very Short Introduction** Jaboury Ghazoul, 2015-05-28. Since the dawn of human civilization, forests have provided us with food resources and energy. The history of human development is also one of forest loss and transformation, and yet even in

our increasingly urbanized societies we remain surprisingly dependent on forests for a wide range of goods and services. Moreover, forests still retain a remarkable hold on our environmental values. In an era of continuing tropical deforestation and temperate forest resurgence and in the midst of uncertainties of climate and land use changes, it is more important than ever to understand what forests are, how they contribute to our livelihoods, and how they underpin our cultural histories and futures. In this Very Short Introduction, Jaboury Ghazoul explores our contrasting interactions with forests as well as their origins, dynamics, and the range of goods and services they provide to human society. Ghazoul concludes with an examination of the recent history of deforestation, transitions to reforestation, and the future outlook for forests, particularly in the context of expected climate change.

**ABOUT THE SERIES** The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area. **Anthropoid Origins** Callum Ross, Richard F. Kay, 2004 This second edition will be an edited volume of interest to those who do research and teach about the evolution of primates. It aims to convey to primatologists, anthropologists, palaeontologists, and neuroscientists the most recent studies of primate phylogeny, the anthropoid fossil record, the evolution of the primate visual system, and the origin of the anthropoid social systems. This title includes a CD-ROM and color figures.

**Systematics, Evolution, and Ecology of Melastomataceae** Renato Goldenberg, Fabián A. Michelangeli, Frank Almeda, 2022-07-20 This book presents a synthesis of critical new information for the Melastomataceae, one of the ten richest families among flowering plants with over 5,800 species that has its diversity highly concentrated in tropical or subtropical areas. It describes the family's global diversity and distribution and summarizes recent advances in systematics, evolution, biogeography, reproductive biology, and ecology.

**The Evolution of Plants** K. J. Willis, J. C. McElwain, 2014 Blends evidence from the fossil record and data from biomolecular studies to tell the story of plant evolution from the earliest forms of life to the present day. Its straightforward explanations and clear illustrations provide the most accessible introduction to plant evolution available.
