

Methyl Bromide: The Green's Enemy

Greenhouse gases (GHG) are particularly worrying for scientists involved from the early 1990s when several reports and the Intergovernmental Panel on Climate Change (IPCC) estimated approximately 50 Gt for CO₂ emissions by 2050. Earth's surface is expected to rise, precipitation altered, the frequency and intensity of droughts and severe weathered phenomena, such as hurricanes, typhoons, and other storms, as the frequency of El Niño and La Niña events is expected to increase. Another example of environmental stress was the depletion of the ozone layer. The Montreal Protocol is another example of international action and cooperation under the United Nations Framework Convention on Climate Change (UNFCCC). It is a multilateral environmental treaty that entered into force in 1992. It is a landmark agreement in the history of international environmental law, as it is the first time that a global agreement on climate change has been reached. The UNFCCC is a framework for international action on climate change, and it is the only global agreement that has been signed by all 195 countries in the world. In this task, you will study an historical data that tracks the emissions of greenhouse gases. Methyl bromide is a greenhouse gas that is used in agriculture. It is a potent greenhouse gas, and it is used in a variety of ways. It is used to control pests and diseases in crops, and it is used to control weeds in lawns and gardens. It is also used in the production of other chemicals.

Task 1: Study the historical data and answer the questions below.

The data is presented in the following table. The first column shows the year, and the second column shows the emissions of methyl bromide in kilotonnes (kt).

Table 1: Methyl bromide emissions (kt) from 1990 to 2010.

Year

1. The first column of the table shows the year. The second column shows the emissions of methyl bromide in kilotonnes (kt). The third column shows the emissions of methyl bromide in kilotonnes (kt) from 1990 to 2010. The fourth column shows the emissions of methyl bromide in kilotonnes (kt) from 1990 to 2010. The fifth column shows the emissions of methyl bromide in kilotonnes (kt) from 1990 to 2010. The sixth column shows the emissions of methyl bromide in kilotonnes (kt) from 1990 to 2010. The seventh column shows the emissions of methyl bromide in kilotonnes (kt) from 1990 to 2010. The eighth column shows the emissions of methyl bromide in kilotonnes (kt) from 1990 to 2010. The ninth column shows the emissions of methyl bromide in kilotonnes (kt) from 1990 to 2010. The tenth column shows the emissions of methyl bromide in kilotonnes (kt) from 1990 to 2010.

an odorless colorless gas that has been used as a soil fumigant and structural fumigant to control pests across a wide range of sectors Because MeBr depletes the stratospheric ozone layer the amount of MeBr produced and imported in the U S was reduced incrementally until it was phased out completely by January 1 2005 pursuant to the U S s obligation under the Montreal Protocol and the Clean Air Act

Methyl Bromide and Stratospheric Ozone Depletion Library of Congress. Congressional Research Service,2006 Discusses regulation and use of methyl bromide MBr as an ozone depleting substance addressing emissions from Mbr use and efforts to acquire U S critical use allowances of MBr

Methyl Bromide and Stratospheric Ozone Depletion ,2006 Methyl Bromide MeBr a widely used pesticide in agriculture is regulated for its potential ozone depleting effects in the Earth s stratosphere Controls on production emissions and trade are mandated internationally under the 1987 Montreal Protocol on Substances that Deplete the Ozone Layer the Protocol and domestically under Title VI of the U S Clean Air Act A ban on production for nonessential uses occurred on December 31 2004 but the Protocol still regulates post 2004 production for critical uses U S agribusinesses have sought exemptions from the Environmental Protection Agency EPA to produce MeBr for certain critical uses after the ban Exemptions are resisted by some Protocol parties and environmental advocates who seek a rapid definitive ban on production and use Chemical companies maintain that they cannot foresee development of effective chemical substitutes for all uses of MeBr in the near term and agricultural producers indicate they may have to rely on less economical and less effective treatments Production allowances for MeBr for 2005 2008 have since been approved under the Protocol and the EPA has approved allocations for registered U S users Due to declining production of manufactured MeBr the EPA would permit commercial trade of pre 2005 inventories This report will be updated as warranted

Methyl Bromide Risk Characterization in California National Research Council,Commission on Life Sciences,Board on Environmental Studies and Toxicology,Committee on Toxicology,Subcommittee for the Review of the Risk Assessment of Methyl Bromide,2000-07-13 Methyl bromide is gaseous pesticide used to fumigate soil crops commodity warehouses and commodity shipping facilities Up to 17 million pounds of

methyl bromide are used annually in California to treat grapes almonds strawberries and other crops Methyl bromide is also a known stratospheric ozone depleter and as such is scheduled to be phased out of use in the United States by 2005 under the United Nations Montreal Protocol In California the use of methyl bromide is regulated by the Department of Pesticide Regulation DPR which is responsible for establishing the permit conditions that govern the application of methyl bromide for pest control The actual permits for use are issued on a site specific basis by the local county agricultural commissioners Because of concern for potential adverse health effects in 1999 DPR developed a draft risk characterization document for inhalation exposure to methyl bromide The DPR document is intended to support new regulations regarding the agricultural use of this pesticide The proposed regulations encompass changes to protect children in nearby schools establish minimum buffer zones around application sites require notification of nearby residents and set new limits on hours that fumigation employees may work The State of California requires that DPR arrange for an external peer review of the scientific basis for all regulations To this end the National Research Council NRC was asked to review independently the draft risk characterization document prepared by DPR for inhalation exposure to methyl bromide The task given to NRC s subcommittee on methyl bromide states the following The subcommittee will perform an independent scientific review of the California Environmental Protection Agency s risk assessment document on methyl bromide The subcommittee will 1 determine whether all relevant data were considered 2 determine the appropriateness of the critical studies 3 consider the mode of action of methyl bromide and its implications in risk assessment and 4 determine the appropriateness of the exposure assessment and mathematical models used The subcommittee will also identify data gaps and make recommendations for further research relevant to setting exposure limits for methyl bromide This report evaluates the toxicological and exposure data on methyl bromide that characterize risks at current exposure levels for field workers and nearby residents The remainder of this report contains the subcommittee s analysis of DPR s risk characterization for methyl bromide In Chapter 2 the critical toxicological studies and endpoints identified in the DPR document are evaluated Chapter 3 summarizes DPR s exposure assessment and the data quality and modeling techniques employed in its assessment are critiqued Chapter 4 provides a review of DPR s risk assessment including the adequacy of the toxicological database DPR used for hazard identification an analysis of the margin of exposure data and appropriateness of uncertainty factors used by DPR Chapter 5 contains the subcommittee s conclusions about DPR s risk characterization highlights data gaps and makes recommendations for future research

Subcommittee on Energy and Resources, 2006 Distributed to some depository libraries in microfiche Methyl Bromide and Ozone Depletion Karthika Vadivel, Thangavel Perumal, Sugumaran Palani, 2015-12-23 Methyl bromide with an approximate tropospheric concentration of 8 pptv and an

atmospheric lifetime of about 0.8 years Montzka et al 2011 The bromine from CH₃Br is thought to deplete from 40 to 100 times more ozone than chlorine Methyl bromide is the largest source of Br to the stratosphere It contributes about 50 % of Br radicals and is believed to be responsible for 15 % of ozone depletion caused by halogen radicals Another 13 % is caused by CH₃Cl and almost 50 % by CFCs CFC concentrations started to decrease in the mid 90s and the Antarctic ozone hole began to re cover However the currently predicted climate change is expected to lead to an increased emission of methyl halides and by that increase their importance for ozone depletion Global warming and further uncontrolled eutrophication of the oceans may result in an unknown increase of the emission of volatile organohalogenes into the global environment While aiming for alternates for CH₃Br it is also prime necessity to reduce the natural release of CH₃Br such as microbial oxidation of bromide and by chemical methods 30% NH₄OH in combination with VIF virtually impermeable film Xuan et al 2011
