Modern Information Retrieval By Ricardo Baeza Yates Pearson Education 2007:

Modern Information Retrieval Ricardo Baeza-Yates, Berthier Ribeiro-Neto, 1999 *Modern Information Retrieval* is a complete textbook for a first course on information retrieval from a computer science perspective. It includes up to date coverage of information retrieval applied to text data and to multimedia.

The Oxford Handbook of Computational Linguistics Ruslan Mitkov, 2022-05-23 Ruslan Mitkov's highly successful *Oxford Handbook of Computational Linguistics* has been substantially revised and expanded in this second edition. Alongside updated accounts of the topics covered in the first edition, it includes 17 new chapters on subjects such as semantic role labelling, text-to-speech synthesis, translation technology, opinion mining and sentiment analysis, and the application of Natural Language Processing in educational and biomedical contexts among many others. The volume is divided into four parts that examine respectively the linguistic fundamentals of computational linguistics, the methods and resources used such as statistical modelling, machine learning and corpus annotation, key language processing tasks including text segmentation, anaphora resolution and speech recognition, and the major applications of Natural Language Processing from machine translation to author profiling. The book will be an essential reference for researchers and students in computational linguistics and Natural Language Processing, as well as those working in related industries.

Search Engine Freedom Joris van Hoboken, 2012-10-01 In this book, the author explores how search media can be incorporated into freedom of expression doctrine, as well as media and communications law and policy more generally. And the book develops a theory of the legal relations between national governments and search media providers on the one hand, and between end users and information providers on the other. Among the many issues covered are the following: role of government under the right to freedom of expression; lack of transparency about the ranking and selection of search results; search engine and ISP intermediary liability; filtering by access providers; freedom of expression and the governance of public libraries; the search engine market; its business model; and the separation rule for advertising; search engine self-regulation; user profiling and personalization; decisions and actions for which search engines should be able to claim protection. The analysis draws on specific legal developments under Article 10 of the European Convention on Human Rights and the United States First Amendment, and investigates issues of diversity, pluralism and freedom of expression as they relate to editorial control in other media. The author concludes with recommendations regarding search engine governance and the proper role of government, indicating which existing elements of the regulatory framework for search media can be improved and offering directions for future legal and empirical research. Considering the ever-growing cultural, political and economic importance of the Internet and the World Wide Web in our societies, and the societal interests involved in the availability of effective search tools, this first in-depth legal analysis of search engine freedom will prove indispensable to the many practitioners and policymakers concerned with freedom of expression in the digital age.

SQL for Data Science Antonio Badia, 2020-11-09 This textbook explains SQL within the context of data science and introduces

the different parts of SQL as they are needed for the tasks usually carried out during data analysis Using the framework of the data life cycle it focuses on the steps that are very often given the short shift in traditional textbooks like data loading cleaning and pre processing The book is organized as follows Chapter 1 describes the data life cycle i e the sequence of stages from data acquisition to archiving that data goes through as it is prepared and then actually analyzed together with the different activities that take place at each stage Chapter 2 gets into databases proper explaining how relational databases organize data Non traditional data like XML and text are also covered Chapter 3 introduces SQL queries but unlike traditional textbooks queries and their parts are described around typical data analysis tasks like data exploration cleaning and transformation Chapter 4 introduces some basic techniques for data analysis and shows how SQL can be used for some simple analyses without too much complication Chapter 5 introduces additional SQL constructs that are important in a variety of situations and thus completes the coverage of SQL queries Lastly chapter 6 briefly explains how to use SQL from within R and from within Python programs It focuses on how these languages can interact with a database and how what has been learned about SQL can be leveraged to make life easier when using R or Python All chapters contain a lot of examples and exercises on the way and readers are encouraged to install the two open source database systems MySQL and Postgres that are used throughout the book in order to practice and work on the exercises because simply reading the book is much less useful than actually using it This book is for anyone interested in data science and or databases It just demands a bit of computer fluency but no specific background on databases or data analysis All concepts are introduced intuitively and with a minimum of specialized jargon After going through this book readers should be able to profitably learn more about data mining machine learning and database management from more advanced textbooks and courses

Advanced Topics in Information Retrieval Massimo Melucci, Ricardo Baeza-Yates, 2011-06-10 Information retrieval is the science concerned with the effective and efficient retrieval of documents starting from their semantic content. It is employed to fulfill some information need from a large number of digital documents. Given the ever growing amount of documents available and the heterogeneous data structures used for storage, information retrieval has recently faced and tackled novel applications. In this book, Melucci and Baeza Yates present a wide spectrum illustration of recent research results in advanced areas related to information retrieval. Readers will find chapters on e.g. aggregated search, digital advertising, digital libraries, discovery of spam and opinions, information retrieval in context, multimedia resource discovery, quantum mechanics applied to information retrieval, scalability challenges in web search engines and interactive information retrieval evaluation. All chapters are written by well known researchers, are completely self contained and comprehensive and are complemented by an integrated bibliography and subject index. With this selection, the editors provide the most up to date survey of topics usually not addressed in depth in traditional text books on information retrieval. The presentation is intended for a wide audience of people interested in information retrieval: undergraduate and graduate students, post doctoral researchers, lecturers and industrial researchers.

Information Retrieval William Bruce Frakes, Ricardo Baeza-Yates, 1992 An edited volume containing data structures and algorithms for information retrieval, including a disk with examples written in C. For programmers and students interested in parsing text, automated indexing, it is the first collection in book form of the basic data structures and algorithms that are critical to the storage and retrieval of documents.

Kowalski,2007-08-23 The growth of the Internet and the

availability of enormous volumes of data in digital form have necessitated intense interest in techniques to assist the user in locating data of interest The Internet has over 350 million pages of data and is expected to reach over one billion pages by the year 2000 Buried on the Internet are both valuable nuggets to answer questions as well as a large quantity of information the average person does not care about The Digital Library effort is also progressing with the goal of migrating from the traditional book environment to a digital library environment The challenge to both authors of new publications that will reside on this information domain and developers of systems to locate information is to provide the information and capabilities to sort out the non relevant items from those desired by the consumer In effect as we proceed down this path it will be the computer that determines what we see versus the human being The days of going to a library and browsing the new book shelf are being replaced by electronic searching the Internet or the library catalogs Whatever the search engines return will constrain our knowledge of what information is available An understanding of Information Retrieval Systems puts this new environment into perspective for both the creator of documents and the consumer trying to locate information
