Molecular Biophysics Structures In Motion:

Molecular Biophysics Michel Daune, 1999 Molecular Biophysics offers a comprehensive introduction to the molecular physics of biological systems. It seeks to explain how the laws and concepts of physics apply to the living world at the molecular and subcellular level with an emphasis on electrical and dynamical behaviour. This book can be consulted by advanced undergraduates or graduate students taking courses in biophysics, physical biochemistry, molecular biophysics, researchers and instructors in these fields.

The Structure of Complex Networks Ernesto Estrada, 2012 The book integrates approaches from mathematics, physics and computer sciences to analyse the organisation of complex networks. Every organisational principle of networks is defined, quantified and then analysed for its influences on the properties and functions of molecular, biological, ecological and social networks.

Spectroscopy and Modeling of Biomolecular Building Blocks Jean-Pierre Schermann, 2007-10-16 Spectroscopy and Modeling of Biomolecular Building Blocks presents an overview of recent advances in the intertwining of the following research fields: photon and electron spectroscopy, quantum chemistry, modelling and mass spectrometry. The coupling of these disciplines offers a new point of view to the understanding of isolated elementary building blocks of biomolecules and their assemblies. It allows the unambiguous separation between intrinsic properties of biomolecular systems and those induced by the presence of their environment. The first chapters provide background in modelling I: frequency resolved spectroscopy using microwave, infrared and UV photons; time resolved spectroscopy in the femtosecond domain and energy resolved electron spectroscopy. II: production of gas phase neutral and ionic biomolecular species, mass spectrometry, ion mobility and BIRD techniques. III: Chapter IV is devoted to case studies of gas phase experimental investigations coupled to quantum or classical calculations. The topics are structural studies of nucleobases and oligonucleotides, peptides and proteins, sugars, neuromolecules, non covalent complexes, chiral systems, interactions of low energy electrons with biomolecules in the radiation chemistry context and very large gas phase biomolecular systems. The fifth chapter concerns the link between gas phase and liquid phase. Different treatments of solvation are illustrated through examples pointing out the influence of progressive addition of water molecules upon properties of nucleobases, peptides, sugars and neuromolecules. Offer a new perspective to the understanding of isolated elementary building blocks of bio molecules. Includes case studies of experimental investigations coupled to quantum or classical calculations.
