Solensky, 2004 Synthesizes current scientific knowledge on the life cycle behavior spectacular migration and conservation of this charismatic insect     *The Monarchs Are Missing* Rebecca E. Hirsch, 2024-01-01 Why are monarch butterflies disappearing Scientists are racing to find answers These iconic orange black and white butterflies flutter across much of the North American continent and are a familiar summer sight in many backyards But in the last twenty years the monarch butterfly population has been decreasing Why Skilled science writer Rebecca E Hirsch takes readers on a quest to discover what scientists already know and what they're hoping to learn In addition she offers tips about what monarch lovers can do to make a difference from planting a butterfly garden to getting the word out about harmful pesticides to taking part in citizen science projects     **The Amazing Monarch** Windle Turley, 2010-09 In *The Amazing Monarch* author and photographer Windle Turley chronicles the life cycle of the monarch butterfly Replete with page after page of full color photographs the book shows the monarchs rarely captured destination wintering grounds The contrast of the orange and black pops off the page as the reader goes on a visual tour in the high mountains of Mexico The multifaceted work also contains poems and quotations focusing on the beauty of these tiny animals that weigh only 0.2 of an ounce With carefully researched text and consultation with leading entomologists *The Amazing Monarch* tracks the monarchs migration and interesting life spans Amazingly this migration only takes place every three to five generations but somehow by the last week of October they

arrive at the same small groups of oyamel fir trees their ancestors populated the year before The handful of roosting sites located at about 10 000 feet altitude each may contain 20 to 30 million monarchs in a single site only a few acres in size After their stay in Mexico it is crucial to head north to get back to Texas and Louisiana and specific types of milkweeds to lay their eggs during a critical three week period If the monarchs reach their destination too early frost on the milkweed could kill the eggs A late arrival may mean the milkweed is no longer succulent Returning from Mexico the fourth or fifth generations will now have lived nine months and before dying will lay eggs during the last two weeks of March A female will lay 400 to 500 eggs during her lifetime and primarily on only one type of milkweed plant but only a small percentage of eggs will actually survive to become adult butterflies The offspring of the first generation travel on to Kansas and Tennessee during April where the female will again lay her eggs and die after having lived only 45 to 60 days The process continues to South Dakota Iowa and Wisconsin in May and the Great Lakes and Canada region in June But the fourth or fifth generation will not breed lay eggs or die instead they head south in the late summer Granted almost unprecedented access by Mexican wildlife officials Turley photographed the insects in their natural habitats at their sanctuaries in Los Saucos near Valle de Bravo State of Mexico and at the Sierra Chincua Sanctuary near Mineral de Anganguo State of Michoacan areas unknown to outsiders until 1975 The World of the Monarch Butterfly Eric S.
