Alt, Max D. Cooper, Fritz Melchers, Klaus Rajewsky, 2007-05-21 In recent years major developments have been made in understanding

various genetic and epigenetic regulatory processes that are critical for the generation of B cell repertoires. These include the role of chromatin regulation and nuclear organization in understating the IgH gene regulation. A role and mechanism of DNA repair proteins in somatic hypermutation has been elucidated. Genetic mutation studies have been instrumental in providing insight into some of the mechanisms involved in targeting CSR to various switch DNA regions located upstream of C region genes especially a role of AID motifs transcription and R loops. Recent studies support a dominant role of receptor editing in central B cell tolerance and signaling pathways that regulate receptor editing in self reactive and non self reactive immature B cells. These were some of the topics of discussion at the 11th International Conference on B cell Biology. These proceedings highlight recent developments in lymphocyte development Ig gene rearrangements and somatic hypermutation chromatin structure modification B lymphocyte signaling and fate receptor editing and autoimmunity.

Molecular Aspects of the Stress Response: Chaperones, Membranes and Networks Peter Csermely, László Vigh, 2007-08-09 We are extremely happy to present the reader this book containing a summary of a well known research field the phenomenon of cellular stress defense from two new angles networks and membranes. The volume starts with an introduction to the concept of molecular chaperones in their original sense. R John Ellis the founder of the chaperone concept describes chaperones as mediators of correct assembly and or misassembly of other macromolecular complexes. This sets the tone of the book where later chapters give detailed examples of the richness of chaperone action by hundreds of other proteins and membrane structures. The reader will learn the role of chaperone classes such as Hsp27 or Hsp90 the action of highly organized chaperone networks in various cellular compartments such as the ER or mitochondrial ER networks as well as the molecular details of the signaling mechanisms leading to chaperone induction during stress. Various special stress defense mechanisms against oxidative stress or dryness will also be covered. Membranes comprise a surprising mixture of stability and dynamics in the cell. Their role in the regulation of the stress response has been accepted only slowly in the field. Two chapters summarize this important aspect of the stress response showing the importance of membrane hyperstructures lipid species composition protein membrane interactions and cold adaptation.

Microarray Technology and Cancer Gene Profiling Simone Mocellin, 2007-08-28 Cancer is a heterogeneous disease in most respects including its cellularity different genetic alterations and diverse clinical behaviors. Traditional molecular analyses are reductionist assessing only one or a few genes at a time thus working with a biologic model too specific and limited to confront a process whose clinical outcome is likely to be governed by the combined influence of many genes. The potential of functional genomics is enormous because for each experiment thousands of relevant observations can be made simultaneously. Accordingly DNA array as other high throughput technologies might catalyze and ultimately accelerate the development of knowledge in tumor cell biology. Although in its infancy the implementation of DNA array technology in cancer research has already provided investigators with novel data and intriguing new hypotheses on the molecular cascade leading to cancerogenesis tumor aggressiveness and sensitivity to

antineoplastic agents Given the revolutionary implications that the use of this technology might have in the clinical management of cancer patients principles of DNA array based tumor gene profiling need to be clearly understood for the data to be correctly interpreted and appreciated In the present book written by leading experts in each field the technical features characterizing this powerful laboratory tool are discussed and the applications so far described in the field of oncology are reviewed

Somatic Cell Nuclear Transfer Peter Sutovsky, 2007-12-22 When I was first approached to edit the present volume I was somewhat reluctant to undertake this humbling task because most of my own scientific expertise is derived from studies of mammalian fertilization rather than somatic cell nuclear transfer SCNT However in the last ten years I was very fortunate to train, collaborate and communicate with a number of distinguished donors many of whom kindly agreed to contribute to the present volume This experience made me appreciate that the understanding of cellular and molecular events during and after SCNT is deeply rooted in our knowledge of fertilization of mammalian ovum by the spermatozoon to which I prefer to refer to as natural fertilization not to say that SCNT should be regarded as unnatural fertilization Unique cellular events arising from SCNT have no parallel in natural fertilization and early pre implantation development The list includes the requirement of donor cell nuclear remodeling disposal of donor cell organelles the possibility of heteroplasmy i.e. presence of mixed mitochondrial genomes and altered mode of oocyte activation Thanks to seminal contributions of my distinguished colleagues the present volume reviews the progress of SCNT technology in major mammalian species including mouse pig and cattle while at the same time parallels can be drawn and distinctions made between the cellular and molecular basis of nuclear transfer and fertilization
