for sending unit wire (8—Fig. 196), electrical wires from alternator and fuel return line (9) at top of fuel filter. Unhook fuel line from base of priority valve support plate and remove hydraulic oil line retaining clamp (10). Detach auxiliary solenoid (11) from mount and move it out of the way without disconnecting lead wires.

On all models, check to be sure that all wires, tubes and other equipment are positioned so that they will be free to separate without catching. Support tractor under transmission. Block front axle to prevent tipping and support weight of engine so that front end and engine may be rolled forward. Refer to Fig. 197. Remove bolts and cap screws attaching engine to transmission and carefully separate by rolling front end and engine forward.

NOTE: It may be necessary to disconnect foot throttle plate and work through opening to remove the upper retaining bolts on models equipped with cabs.

CAUTION: Carefully observe the joint between engine and transmission while loosening bolts to be sure that front end and tractor are supported evenly. Change support as necessary if parting surfaces are not parallel. Dowel pins are installed between engine and transmission, but use of dowel guide studs is recommended when separating and rejoining.

When rejoining, install guide studs, then carefully move engine back against transmission housing while aligning splines of clutch with transmission input shaft and splines of flywheel adapter with pto shaft. If splines do not align, DO NOT force together, but turn flywheel slowly while sliding together.
