Learning to Communicate in Science and Engineering Mya Poe, Neal Lerner, Jennifer Craig, 2010-02-05 Case studies and pedagogical strategies to help science and engineering students improve their writing and speaking skills while developing professional identities. To many science and engineering students the task of writing may seem irrelevant to their future professional careers. At MIT however students discover that writing about their technical work is important not only in solving real world problems but also in developing their professional identities. MIT puts into practice the belief that engineers who don't write well end up working for engineers who do write well requiring all students to take communications intensive classes in which they learn from MIT faculty and writing instructors how to express their ideas in writing and in presentations. Students are challenged not only to think like professional scientists and engineers but also to communicate like them. This book offers in depth case studies and pedagogical strategies from a range of science and engineering communication intensive classes at MIT. It traces the progress of seventeen students from diverse backgrounds in seven classes that span five departments. Undergraduates in biology attempt to turn scientific findings into a research article graduate students learn to define their research for scientific grant writing undergraduates in biomedical engineering learn to use data as evidence and students in aeronautic and astronautic engineering learn to communicate collaboratively. Each case study is introduced by a description of its theoretical and curricular context and an outline of the objectives for the students activities. The studies describe the on the ground realities of working with faculty staff and students to achieve communication and course goals offering lessons that can be easily applied to a wide variety of settings and institutions.

Microbes and Microbial Biotechnology for Green Remediation Junaid Ahmad Malik, 2022-06-14 Microbes and Microbial Biotechnology for Green Remediation provides a comprehensive account of sustainable microbial treatment technologies. The research presented highlights the significantly important microbial species involved in remediation the mechanisms of remediation by various microbes and suggestions for future improvement of bioremediation technology. The introduction of contaminants due to rapid urbanization and anthropogenic activities into the environment causes unsteadiness and distress to the physicochemical systems including living organisms. Hence there is an immediate global demand for the diminution of such contaminants and xenobiotics which can otherwise adversely affect the living organisms. Over time microbial remediation processes have been accelerated to

produce better eco friendlier and more biodegradable products for complete dissemination of these xenobiotic compounds The advancements in microbiology and biotechnology lead to the launch of microbial biotechnology as a separate area of research and contributed dramatically to the development of the areas such as agriculture environment biopharmaceutics and fermented foods Microbes stand as an imperative efficient green and economical alternative to conventional treatment technologies The proposed book provides cost effective and sustainable alternatives This book serves as a reference for graduate and postgraduate students in environmental biotechnology and microbiology as well as researchers and scientists working in the laboratories and industries involved in research related to microbiology environmental biotechnology and allied research Discusses important microbial activities such as biofertilizer biocontrol biosorption biochar biofilm biodegradation bioremediation bioclogging and quorum sensing Covers all the advanced microbial bioremediation techniques which are finding their way from the laboratory to the field for revival of the degraded agro ecosystems Examines the role of bacteria fungi microalgae *Bacillus* sp *Prosopis juliflora* *Deinococcus radiodurans* *Pseudomonas methanotrophs* siderophores and PGPRs as the biocontrol and green remediator agents for soil sustainability
