Nematodes and the Biological Control of Insect Pests RA Bedding, RJ Akhurst, HK Kaya, 1993-01-01 Environmental and public health problems arising from the use of chemical insecticides have led to an increasing demand for alternatives for insect pest control Together with this widespread public concern resulting in governmental bans on many of the most effective insecticides and development of insecticide resistance has severely reduced the range of useful insecticides available Alternative control measures such as the biological control of pest insects with parasitoids and predators and microbial biocides have been in field use for several decades Although these alternatives are being continually improved most insect pests are nonetheless still controlled with chemical insecticides This book presents the latest work on the biological control of insects using nematodes it covers a range of topics that will help provide a better understanding of the potential problems involved in developing these nematodes as biological control agents Nematodes infect hundreds of different species from most orders of insects and affect their insect hosts in a variety of ways

Nematode Biopesticides Anwar L. Bilgrami, Anish Khan, 2022-05-26 Plant Nematode Biopesticides presents the most current knowledge on various categories of biopesticides used in the management of nematode pests of crops or those that have significant potential as biological control agents. This book presents an exploratory and investigatory compilation and explanation of the actions and potentials of predatory nematodes, microbial agents, plant and other organic products, nanobiopesticides, and predatory invertebrates as biopesticides of nematode pests of agricultural crops. It is of unique importance and value as the only currently available single volume resource focusing on plant parasitic nematodes as the pests and biopesticides. In addition, the book addresses common reservations in using biopesticides either alone or in integrated pest management programs, providing advanced insights on various biopesticidal agents and products. Biopesticides may be microbial (nematodes, bacteria, fungi, virus, herbs, etc.), plant incorporated protectants (PIPs), plant products (citronella oil, neem oil, capsaicin, pyrethrin, etc.), synthetic biochemical molecules (pheromones, semiochemicals, plant extracts, or nanobiopesticides). Includes emerging areas of nanobiopesticides, chemical aspects of biopesticides, and plant exudates. Presents strategies for researching nematodal biological control. Addresses problems related to the mass production, manufacture, and formation of biopesticides from both animal and plant products. Sustainable Management of Nematodes in Agriculture, Vol.1: Organic Management Kamal Kishore Chaudhary, Mukesh Kumar Meghvansi, 2022-09-12 The present work covers many aspects of plant nematode management using organic strategies. These range from applications of latest understandings of fundamental concepts, mechanisms of nematode control, to modern tools and techniques used in efficacy evaluation. The Volume also includes some case studies. Applied aspects of organic nematode pest management. Chemical and physical control measures used for nematode management have their own implications. Against this backdrop, organic management of plant nematodes appears as a more rational and sustainable approach. However, concise information on the current topic is scarce. This book is a sincere effort to bridge this void as we aim to provide the most updated critical and in-depth knowledge synthesized by many experts working in the field of plant nematology worldwide. **Nematode Disease Complexes in Agricultural Crops** Mujeeb Rahman Khan, 2025-07-01 Plant diseases where two or more pathogens are involved in the infection process are commonly termed as complex, and their diagnosis and subsequent control become more complicated and challenging. A disease complex is produced through synergistic interaction between pathogens such as plant nematodes and soil-borne fungi or bacteria. Disease complexes which result from the interaction between nematodes and other pathogens are found on a range of agricultural crops globally and cause great crop damage. Some pathogens, e.g., *Fusarium*, *Xanthomonas*, etc., become more aggressive in cohabitation with nematodes even if the inoculum density is low or the host cultivar is resistant. Plant nematodes can also act as vectors and carry fungi and bacteria to the susceptible tissue or introduce plant viruses into the host. Some nematodes also need a vector for their spread, causing serious diseases like pine wilt and red ring. **Nematode Disease Complexes in Agricultural Crops** discusses the roles plant nematodes may play in the

formation of a disease complex It provides an account of the agricultural significance aetiology and epidemiology of important disease complexes and their management strategies based on integration of conventional current and innovative approaches **Commercial Production of Nematode Antagonistic Bio-Agents** Mr. Rohit Manglik,2024-07-28
