Organelle and Molecular Targeting Lara Scheherazade Milane, Mansoor M. Amiji, 2021-12-27 We have surpassed the omics era and are truly in the Age of Molecular Therapeutics The fast paced development of SARS CoV 2 vaccines such as the mRNA vaccines encoding the viral spike protein demonstrated the need for and capability of molecular therapy and nanotechnology based solutions for drug delivery In record speed the SARS CoV 2 viral RNA genome was sequenced and shared with the scientific community allowing the rapid design of molecular therapeutics The mRNA vaccines exploit the host cell endoplasmic reticulum to produce viral spike proteins for antigen presentation and recognition by the innate and adaptive immune system Lipid nanoparticles enable the delivery of the fragile degradation sensitive nucleic acid payloads Molecular based therapeutics and nanotechnology solutions continue to drive the scientific and medical response to the COVID 19 pandemic as new mRNA DNA and protein based vaccines are developed and approved and the emergency use approved vaccines are rapidly manufactured and distributed throughout the globe The need for molecular therapies and drug delivery solutions is clear and as these therapies progress and become more specialized there will be important advancements in organelle targeting For example using organelle targeting to direct lipid nanoparticles with mRNA payloads to the endoplasmic reticulum would increase the efficacy of mRNA vaccines reducing the required dose and therefore the biomanufacturing demand Likewise improving the delivery of DNA therapeutics to the nucleus would improve efficacy

Organelles and molecules have always been drug targets but until recently we have not had the tools or capability to design and develop such highly specific therapeutics. Organelle targeting has far reaching implications. For example mitochondria are central to both energy production and intrinsic apoptosis. Effectively targeting and manipulating mitochondria has therapeutic applications for diseases such as myopathies, cancer, neurodegeneration, progerias, diabetes, and the natural aging process. The SARS CoV 2 vaccines that exploit the endoplasmic reticulum for mRNA vaccines and the nucleic translational process. DNA vaccines attest to the need for organelle and molecular therapeutics. This book covers the status, demand, and future of organelle and molecularly targeted therapeutics that are critical to the advancement of modern medicine. Organelle and molecular targeting is the drug design and drug delivery approach of today and the future; understanding this approach is essential for students, scientists, and clinicians contributing to modern medicine.

Bioorganic Chemistry of Biological Signal Transduction Herbert Waldmann, 2001. The transduction of signals from the extracellular space across the plasma membrane into the interior of cells and ultimately to the nucleus, where in response to such external signals the transcription of the genetic code is influenced, belongs to the most fundamental and important events in the regulation of the life cycle of cells. During recent years, several signal transduction cascades have been elucidated which regulate, for instance, the growth and the proliferation of organisms as diverse as mammals, flies, worms, and yeast. The general picture which emerged from these investigations is that nature employs a combination of non-covalent ligand-protein and protein-protein interactions together with a set of covalent protein modifications to generate the signals and transduce them to their destinations. The ligands

which are recognized may be low molecular weight compounds like lipids inositol derivatives steroids or microbial products like cyclosporin They may be proteins like for instance growth factors or intracellular adaptor proteins which carry SH2 or SH3 domains and they may be specific DNA stretches which are selectively recognized by transcription factors These and other aspects of biological signal transduction provide an open and rewarding field for investigations by scientists from various different disciplines of biology medical research and chemistry working in academic research institutions or in industry
