Educational lectures The pathogenesis of human cancer metastasis I Fidler Cancer is a collection of malignancies with each cancer of each organ consisting of numerous subsets This biologic and clinical heterogeneity is probably due to the different etiologies origins and selection pressures Despite this heterogeneity all malignant neoplasms have a uniform characteristic the ability to invade host tissues and produce metastases Clinical observations of cancer patients and studies with experimental rodent tumors have revealed that certain tumors produce metastasis to specific organs independent of vascular anatomy rate of blood flow and number of tumor cells delivered to each organ The distribution and fate of hematogeneously disseminated radiolabelled tumor cells in experimental rodent systems amply demonstrate that tumor cells reach the microvasculature of many organs
