Noninvasive Imaging of Cardiac Metabolism Ernst E. van der Wall, 2012-12-06 F J Th WACKERS
Metabolic imaging The future of cardiovascular nuclear imaging Since cardiovascular nuclear imaging emerged as a new subspecialty in the mid 1970s the field has gone through an explosive growth Radionuclide techniques became readily recognized as important new diagnostic aids in the armamentarium of the clinical cardiologist Initially cardiovascular nuclear imaging focused on static myocardial imaging using either thallium 201 or technetium 99m pyrophosphate for diagnosing acute myocardial infarction Shortly thereafter multigated equilibrium radionuclide angiocardigraphy became the most widely used noninvasive method for assessing cardiac function Furthermore attention and clinical application shifted towards the use of radionuclide techniques in conjunction with exercise testing either with thallium 201 myocardial perfusion imaging or technetium 99m left ventricular function studies The future of cardiovascular nuclear imaging appeared exciting and promising However around 1980 pessimists predicted the premature demise of cardiovascular nuclear imaging with the introduction of digital subtraction angiography and nuclear magnetic resonance imaging These doomsayers have been proven wrong in 1985 cardiovascular nuclear imaging is thriving and in many centers even expanding Although digital subtraction angiography and magnetic resonance imaging provided exquisite anatomic detail for practical evaluation of patients with ischemic heart disease in the Coronary Care Unit or exercise laboratory nuclear techniques appeared to be more practical

Arterial and Venous Systems in Essential Hypertension Michel Emile Safar, 2012-12-06 The hemodynamic mechanisms of hypertension are often limited to the study of three dominant parameters blood pressure cardiac output and vascular resistance Accordingly the development of hypertension is usually analyzed in terms of a struggle between cardiac output and vascular resistance resulting in the classical pattern of normal cardiac output and increased vascular resistance thus indicating a reduction in the caliber of small arteries However during the past years the clinical management of hypertension has largely modified these simple views While an adequate control of blood pressure may be obtained with antihypertensive drugs arterial complications may occur involving mainly the coronary circulation and

suggesting that several parts of the cardiovascular system are altered in hypertension. Indeed, disturbances in the arterial and the venous system had already been noticed in animal hypertension. The basic assumption in this book is that the overall cardiovascular system is involved in the mechanisms of the elevated blood pressure in patients with hypertension, not only the heart and small arteries but also the large arteries and the venous system. For that reason, the following points are emphasized: First, the cardiovascular system in hypertension must be studied not only in terms of steady flow but also by taking into account the pulsatile components of the heart and the arterial systems. Second, arterial and venous compliances are altered in hypertension and probably reflect intrinsic alterations of the vascular wall.

Invasive Cardiovascular Therapy
H.H. Hilger, Vinzenz Hombach, W.J. Rashkind, 2012-12-06

In recent years, considerable progress and new developments in diagnostic and interventional cardiology have been observed, such as balloon angioplasty of coronary artery stenoses, reperfusion techniques in acute myocardial infarction, new pacing and cardioversion/defibrillation techniques in ventricular tachyarrhythmias. On 5-8 May 1985, an international symposium on Invasive Cardiovascular Therapy was held in Cologne, which provided a survey on the experimental and routine therapeutic measures presently available and practiced in cardiovascular medicine. This volume is based on the oral presentations given during the symposium. In five chapters, the most important traditional and new interventional techniques are discussed by experts in the field. Chapter I contains a description of results from catheter palliation of congenital shunt disorders or relief of congenital pulmonary or aortic valve stenoses, as well as the recent experience with surgical repair of single ventricle, Fallot's tetralogy, and tricuspid atresia. Chapter II presents the surgical results of valve replacement with different valve prostheses in acquired valvular disease, the surgical management of bacterial endocarditis, as well as the various techniques of partial transient left heart support devices and of cardiac transplantation. In Chapter III, the invasive management of chronic coronary heart disease, peripheral vascular disease by balloon catheter or laser techniques, and the surgical approach to coronary heart disease are discussed.
