Human Factors Models for Aviation Accident Analysis and Prevention Thomas G.C. Griffin, Mark S. Young, Neville A. Stanton, 2017-03-02 The investigation and modelling of aviation accident causation is dominated by linear models Aviation is however a complex system and as such suffers from being artificially manipulated into non complex models and methods This book addresses this issue by developing a new approach to investigating aviation accident causation through information networks These networks centralise communication and the flow of information as key indicators of a system s health and risk This holistic approach focuses on the system environment the activity that takes place within it the strategies used to conduct this activity the way in which the constituent parts of the system both human and non human interact and the behaviour required Each stage of this book identifies and expands upon the potential of the information network approach maintaining firm focus on the overall health of a system The book s new model offers many potential developments and some key areas are studied in this research Through the centralisation of barriers and information nodes the method can be applied to almost any situation The application of Bayesian mathematics to historical data populations provides scope for studying error migration and barrier manipulation The book also provides application of these predictions to a flight simulator study for the purposes of validation Beyond this it also discusses the applicability of the approach to industry Through working with a legacy airline the methods discussed are used as the basis for a new and prospective safety management system

**Intelligence and Security Informatics** Hsinchun Chen, Reagan Moore, Daniel D. Zeng, John Leavitt, 2004-08-24 The past two years have seen significant interest and progress made in national and homeland security research in the areas of information technologies organizational studies and security related public policy Like medical and biological research which is facing significant information overload and yet also tremendous opportunities for new innovation the communities of law enforcement criminal analysis and intelligence are facing the same challenge As medical informatics and bioinformatics have become major fields of study the science of intelligence and

security informatics is now emerging and attracting interest from academic researchers in related fields as well as practitioners from both government agencies and industry. Broadly defined, intelligence and security informatics is the study of the development and use of advanced information technologies and systems for national and homeland security related applications through an integrated technological, organizational, and policy based approach. The First Symposium on Intelligence and Security Informatics (ISI2003) was held in June 2003 in Tucson, Arizona. It provided a stimulating intellectual forum of discussions among previously disparate communities: academic researchers in information technologies, computer science, public policy, and social studies; local, state, and federal law enforcement; and intelligence experts and information technology industry consultants and practitioners. Building on the momentum of ISI2003, we held the Second Symposium on Intelligence and Security Informatics (ISI2004) in June 2004 in Tucson, Arizona.

Communicating Biological Sciences Richard Elliott, 2016-05-23. Recent scandals in the biosciences have highlighted the perils of communicating science, leading many observers to ask questions about the pressures on scientists and the media to hype up claims of scientific breakthroughs. Journalists, science writers, and scientists themselves have to report complex and rapidly developing scientific issues to society yet work within conceptual and temporal constraints that shape their communication. To date, there has been little reflection on the ethical implications of science writing and science communication in an era of rapid change. Communicating Biological Sciences discusses the ethics of science communication in light of recent developments in biotechnology and biomedicine. It focuses on the role of metaphors in the creation of visions and the framing of scientific advances as well as their impact on patterns of public acceptance and rejection, trust, and scepticism. Its rigorous investigation will appeal not only to science writers and scientists but also to scholars of sociology, science and technology studies, media, and journalism.
