Papagiannakis, 2010 This paper provides a summary of the weigh in motion WIM calibration practices used by state highway and load enforcement agencies in the United States The detailed statistical data presented were collected through a web based survey questionnaire It covers three common WIM calibration practices namely utilizing multiple passes of test trucks utilizing traffic stream vehicles of known static weight and employing only WIM data quality control QC techniques To put the actual practice in perspective an overview is provided of the current WIM calibration standard ASTM E1318 02 and the new provisional standard for quantifying pavement roughness at the approach to WIM systems AASHTO MP 14 05 Most agencies use a combination of two or more of these methods for WIM system calibration The majority of agencies uses WIM data QC on a routine basis and they resort to one of the other two calibration methods when WIM data quality deteriorates Test truck calibration typically involves one or two Class 9 trucks running at several speeds Few of these agencies however perform actual pavement roughness measurements on the approach to the WIM sites Agencies that use traffic stream vehicles of known static weight for WIM calibration obtain static weights manually using permanent static scales The method involves up to 100 trucks selected by class speed or both class and speed Agencies use a variety of traffic elements and formulas for computing calibration factors Similarly a variety of traffic data element errors are computed and various approaches are used for computing calibration factors In the light of these findings the paper provides a number of recommendations for improving current WIM calibration practices
