

The background features a complex diagram of a microfluidic device. At the top left, a red rectangular box contains a wavy line and circular patterns. To its right, a large yellow oval depicts a channel with two reservoirs on the left (one containing particles, the other a piston) and a valve on the right. Below this, three yellow ovals are arranged horizontally: the first shows a piston, the second shows a wavy line in a channel, and the third shows a mixture of positive and negative charges. Dashed lines connect these elements, suggesting a flow or process sequence.

Portable Biosensing of Food Toxicants and Environmental Pollutants Dimitrios P. Nikolelis, Theodoros Varzakas, Arzum Erdem, Georgia-Paraskevi Nikoleli, 2013-10-21. Biosensors are poised to make a large impact in environmental, food and biomedical applications as they clearly offer advantages over standard analytical methods including minimal sample preparation and handling, real time detection, rapid detection of analytes and the ability to be used by non skilled personnel. Covering numerous applications of biosensors used in food and the environment, *Portable Biosensing of Food Toxicants and Environmental Pollutants* presents basic knowledge on biosensor technology at a postgraduate level and explores the latest advances in chemical sensor technology for researchers. By providing useful state of the art information on recent developments in biosensing devices, the book offers both newcomers and experts a roadmap to this technology. In the book, distinguished researchers from around the world show how portable and handheld nanosensors such as dynamic DNA and protein arrays enable rapid and accurate detection of environmental pollutants and pathogens. The book first introduces the basic principles of biosensing for newcomers to the technology. It then explains how the integration of a receptor can provide analytically useful information. It also describes trends in biosensing and examines how a small sized device can have portability for the in situ determination of toxicants. The book concludes with several examples illustrating how to determine toxicants in food and environmental samples.

Electroosmotic pumps with electrochemically active electrodes Per Erlandsson, 2018-03-20 Electrokinetic phenomena motion caused by an applied

electric field can be used to separate molecules based on charge as in capillary electrophoresis or pump liquids with electroosmosis As microfluidic devices are becoming more advanced involving multiple stages sequential reactions and requiring smaller amounts of reagent the demand for precise fluid control and integrated electrodes increases One of the main reasons for developing lab on a chip devices is the realization of decentralized diagnostics allowing patients to be monitored without going to a hospital or diagnosed in situations where healthcare infrastructure is not available The first paper of this thesis investigates the differences in characteristics between an electroosmotic pump with metal electrodes and one using electrochemically active polymer electrodes With metal electrodes reactions normally take place at the metal electrolyte interface where the electrolyte or species therein are either reduced or oxidized to maintain an electric current For water based electrolytes the electrolysis of water produces pH altering species and gas which can interfere with microfluidic systems As electrochemically active electrodes can themselves be reduced or oxidized the amount of undesired reactions at the polymer electrolyte interface can be significantly decreased The second and third papers investigate the use of porous potassium monoliths as electroosmotic pumps in microfluidic devices using electrochemically active electrodes Porous potassium silicate monoliths were created inside fused silica capillaries in order to increase the pumps resistance to pressure driven flow Potassium silicate structures without a fused silica capillary as a scaffold were produced in molds of polydimethylsiloxane Asymmetric pumping properties of these stand alone monolith was sometimes observed Monoliths were produced in conical molds in an attempt to increase the asymmetric behavior
