Charles Darwin

On The Origin Of Species:

On the Origin of Species Charles Darwin, 2019 On the Origin of Species is the great work of Darwin's life The whole first edition of 1250 copies was exhausted on the day of issue The first four chapters explain the operation of artificial selection by man and of natural selection in consequence of the struggle for existence The fifth chapter deals with the laws of variation and causes of modification other than natural selection The five succeeding chapters consider difficulties in the way of a belief in evolution generally as well as in natural selection The three remaining chapters omitting the recapitulation which occupies the last deal with the evidence for evolution The theory which suggested a cause of evolution is thus given the foremost place and the evidence for the existence of evolution considered last of all *The Origin of Species* Charles Darwin, 1958 The Origin of Species by Charles Darwin is part of the Barnes some include illustrations of historical interest Barnes Noble Classics pulls together a constellation of influencesbiographical historical and literaryto enrich each reader's understanding of these enduring works On December 27 1831 the young naturalist Charles Darwin left Plymouth Harbor aboard the HMS Beagle For the next five years he conducted research on plants and animals from around the globe amassing a body of evidence that would culminate in one of the greatest discoveries in the history of mankindthe theory of evolution Darwin presented his stunning insights in a landmark book that forever altered the way human beings view themselves and the world they live in In The Origin of Species he convincingly demonstrates the fact of evolution that existing animals and plants cannot have appeared separately but must have slowly transformed from ancestral creatures Most important the book fully explains the mechanism that effects such a transformation natural selection the idea that made evolution scientifically intelligible for the first time One of the few revolutionary works of science that is engrossingly readable The Origin of Species not only launched the science of modern biology but also has influenced virtually all subsequent literary philosophical and religious thinking George Levine Kenneth Burke Professor of English Literature at Rutgers University has written extensively about Darwin and the relation of science and literature particularly in Darwin and the Novelists He is the author of many related books including The Realistic Imagination Dying to Know and his birdwatching memoirs Lifebirds *On the Origin of Species* Charles Darwin, 2016-02-22 INTRODUCTION When on board H M S Beagle as naturalist I was much struck with certain facts in the distribution of the inhabitants of South America and in the geological relations of the present to the past inhabitants of that continent These facts seemed to me to throw some light on the origin of species that mystery of mysteries as it has been called by one of our greatest philosophers On my return home it occurred to me in 1837 that something might perhaps be made out on this question by patiently accumulating and reflecting on all sorts of facts which could possibly have any bearing on it After five years work I allowed myself to speculate on the subject and drew up some short notes these I enlarged in 1844 into a sketch of the conclusions which then seemed to me probable from that period to the present day I have steadily pursued the same object I hope that I may be excused for entering on these personal details as I give them to

show that I have not been hasty in coming to a decision My work is now nearly finished but as it will take me two or three more years to complete it and as my health is far from strong I have been urged to publish this Abstract I have more especially been induced to do this as Mr Wallace who is now studying the natural history of the Malay archipelago has arrived at almost exactly the same general conclusions that I have on the origin of species Last year he sent to me a memoir on this subject with a request that I would forward it to Sir Charles Lyell who sent it to the Linnean Society and it is published in the third volume of the Journal of that Society Sir C Lyell and Dr Hooker who both knew of my work the latter having read my sketch of 1844 honoured me by thinking it advisable to publish with Mr Wallace s excellent memoir some brief extracts from my manuscripts I much regret that want of space prevents my having the satisfaction of acknowledging the generous assistance which I have received from very many naturalists some of them personally unknown to me I cannot however let this opportunity pass without expressing my deep obligations to Dr Hooker who for the last fifteen years has aided me in every possible way by his large stores of knowledge and his excellent judgment In considering the Origin of Species it is quite conceivable that a naturalist reflecting on the mutual affinities of organic beings on their embryological relations their geographical distribution geological succession and other such facts might come to the conclusion that each species had not been independently created but had descended like varieties from other species Nevertheless such a conclusion even if well founded would be unsatisfactory until it could be shown how the innumerable species inhabiting this world have been modified so as to acquire that perfection of structure and coadaptation which most justly excites our admiration Naturalists continually refer to external conditions such as climate food etc as the only possible cause of variation In one very limited sense as we shall hereafter see this may be true but it is preposterous to attribute to mere external conditions the structure for instance of the woodpecker with its feet tail beak and tongue so admirably adapted to catch insects under the bark of trees In the case of the misseltoe which draws its nourishment from certain trees which has seeds that must be transported by certain birds and which has flowers with separate sexes absolutely requiring the agency of certain insects to bring pollen from one flower to the other it is equally preposterous to account for the structure of this parasite with its relations to several distinct organic beings by the effects of external conditions or of habit or of the volition of the plant itself The author of the Vestiges of Creation would I presume say that after a certain unknown number of generations some bird had given birth to a woodpecker and some plant to the misseltoe and that these had been produced perfect as we now see them but this assumption seems to me to be no explanation for it leaves the case of the coadaptations of organic beings to each other and to their physical conditions of life untouched and unexplained The Origin of Species Charles Darwin, 2019-02-26 Discover this beautiful special edition of Charles Darwin s groundbreaking theory on human evolution When the eminent naturalist Charles Darwin returned from South America on board the HMS Beagle in 1836 he brought with him the notes and evidence that would form the basis of a world changing theory the evolution of species by a

process of natural selection This theory published as On the Origin of Species in 1859 is the basis of modern biology and the concept of biodiversity Its publication sparked a fierce scientific religious and philosophical debate which continues to this day PATTERNS OF LIFE SPECIAL EDITIONS OF GROUNDBREAKING SCIENCE BOOKS **On the Origin of Species** Charles Darwin,2009-06-01 Darwin consolidated a lifetime of work in On the Origin of Species compiling his discoveries from the voyage of the Beagle his experiments research and correspondence He argues for the transmutation of species over time by the process of natural selection His work laid the foundation of evolutionary biology though when it was published it caused tremendous religious and philosophical debates Darwin s work is still seen by many people to oppose Christian beliefs
