

1. Verify battery voltage on red/purple lead terminal (A) and a good ground connection at black lead terminal B.
2. Attach voltmeter negative lead to a good engine ground. Attach voltmeter positive to red/purple lead terminal (E). A reading of battery voltage indicates a good 10 amp in-line fuse or 10 amp circuit breaker. No voltage indicates an open fuse, or the circuit breaker is not reset or is defective. On models with the in-line 10 amp fuse, replace it and retest. On models with the 10 amp circuit breaker, reset the circuit breaker and test again. Replace the entire assembly if circuit breaker tests defective.
3. With voltmeter negative lead still attached to engine ground, attach voltmeter positive lead to green/white lead terminal (D). Activate the trim-down switch. Voltmeter should indicate battery voltage indicating a good trim-down relay. No or very low voltage indicates a problem in the circuit to and from the trim switch. Find and correct the problem before continuing.
4. Move the volt meter positive lead to the green lead terminal (C). Activate the trim-down switch. Battery voltage indicates a good trim-down relay. No or low voltage indicates a bad relay. Replace the entire assembly.
5. Follow the procedures in Step 3 and 4 to test the trim-up relay. Connect the voltmeter to blue/white lead terminal (F) and blue lead terminal (G). Low or no voltage readings indicate problems in the circuit or bad relay. Repair or replace as necessary.
6. Attach the red voltmeter lead to the red/purple terminal (E). Attach the black voltmeter lead to the solid green terminal ~ and then to the solid blue wire terminal (C) with the trim switch in the off (neutral) position. Voltage should read within one volt of the battery voltage. If the voltage is near zero, the relay is defective and the relay assembly should be replaced.
