Network Defense: Fundamentals and Protocols EC-Council, 2010-03-29

The Network Defense Series from EC Council Press is comprised of 5 books designed to educate learners from a vendor-neutral standpoint how to defend the networks they manage. This series covers the fundamental skills in evaluating internal and external threats to network security and design how to enforce network level security policies and how to ultimately protect an organization's information. The books in the series cover a broad range of topics from secure network fundamentals, protocols, analysis, standards, and policy hardening infrastructure to configuring IPS, IDS, firewalls, bastion host, and honeypots. Learners completing this series will have a full understanding of defensive measures taken to secure their organization's information and along with the proper experience, these books will prepare readers for the EC Council Network Security Administrator E-NSA certification.

A thorough understanding of network technologies and security fundamentals is required before designing any defensive measure to protect an organization's information. This book, the first in the series, is designed to provide the foundational knowledge to the potential Security Administrator from a vendor-neutral perspective, covering everything from standard secure network topology, network media, and transmission classifications and a complete view of network security equipment.

Proactive and Dynamic Network Defense Cliff Wang, Zhuo Lu, 2019-05-22

This book discusses and summarizes current research issues, identifies challenges, and outlines future directions for proactive and dynamic network defense. This book also presents the latest fundamental research results toward understanding proactive and dynamic network defense by top researchers in related areas. It includes research results that offer formal frameworks to define proactive and dynamic network defense and develop novel models to analyze and evaluate proactive designs and strategies in computer systems, network systems, cyber-physical systems, and wireless networks. A wide variety of scientific techniques have been highlighted to study these problems in the fundamental domain. As the convergence of our physical and

digital worlds grows fast pace protecting information systems from being tampered or unauthorized access is becoming one of the most importance issues The traditional mechanisms of network defense are built upon a static passive and reactive nature which has insufficient to defend against today s attackers that attempt to persistently analyze probe circumvent or fool such mechanisms It has not yet been fully investigated to address the early stage of cyber kill chain when adversaries carry out sophisticated reconnaissance to plan attacks against a defense system Recently proactive and dynamic network defense has been proposed as an important alternative towards comprehensive network defense Two representative types of such defense are moving target defense MTD and deception based techniques These emerging approaches show great promise to proactively disrupt the cyber attack kill chain and are increasingly gaining interest within both academia and industry However these approaches are still in their preliminary design stage Despite the promising potential there are research issues yet to be solved regarding the effectiveness efficiency costs and usability of such approaches In addition it is also necessary to identify future research directions and challenges which is an essential step towards fully embracing proactive and dynamic network defense This book will serve as a great introduction for advanced level computer science and engineering students who would like to start R D efforts in the field of proactive and dynamic network defense Researchers and professionals who work in this related field will also find this book useful as a reference

A Computer Network Model for the Evaluation of Moving Target Network Defense Mechanisms Benjamin Fredrick Wheeler,2014 In order to combat the increasing complexity of cyber attacks a new category of cyber defense called dynamic cyber defense has been the focus of a significant amount of work Dynamic cyber defense mechanisms aim to protect networks by modifying their attributes in order to confuse would be attackers Currently the majority of the existing mechanisms are purely theoretical and have been the subject of minimal performance analysis There has also been almost no effort to perform comparative analysis of different techniques As a result there is a great need for a method of modeling different mechanisms within a single system in order to conduct comprehensive comparative performance analysis This work develops the framework of a system called Dynamic Virtual Terrain DVT which can be used for comparative analysis of dynamic cyber defense mechanisms under identical conditions DVT models network topology using nodes which represent members of a network and access permissions which describe the connectivity of the network DVT also defines a generic dynamic cyber defense algorithm that can be extended in order to implement a hierarchy of techniques An implementation of DVT is created in order to perform experiments with IP address hopping port hopping and dynamic firewall mechanisms in a cyber attack simulation environment Attack scenarios are developed to evaluate the performance of the mechanisms under identical conditions and the results of simulating these scenarios are used to analyze the performance of the implemented mechanisms Abstract
