

Neural stem cells (NSCs) are multipotent adult stem cells that can self-renew and generate new neurons and glial cells, which are supporting cells.

NSCs are a promising treatment for nervous system diseases because they can be activated or transplanted into areas of injury to promote regeneration.

Neural Stem Cell Research Neural Stem Cell Research:

Neural Stem Cell Research Erik V. Grier, 2006 Among the many applications of stem cell research are nervous system diseases diabetes heart disease auto immune diseases as well as Parkinson s disease end stage kidney disease liver failure cancer spinal cord injury multiple sclerosis Parkinson s disease and Alzheimer s disease Stem cells are self renewing unspecialised cells that can give rise to multiple types all of specialised cells of the body Stem cell research also involves complex ethical and legal considerations since they involve adult foetal tissue and embryonic sources This book brings together leading research from throughout the world in this frontier field **Neural Stem Cells** Tanja Zigova, Paul R. Sanberg, Juan R. Sanchez-Ramos, 2008-02-03 Over the last decade neural stem cell research has provided penetrating insights into the plasticity and regenerative potential of the brain Stem cells have been isolated from embryonic as well as adult central nervous system CNS Many non CNS mammalian tissues also contain stem cells with a more limited repertoire the replacement of tissue specific cells throughout the li time of the organism Progress has been made in understanding fundamental stem cell properties that depend on the interplay of extrinsic signaling factors with intrinsic genetic programs within critical time frames With this growing knowledge scientists have been able to change a neural stem cell s fate der certain conditions neural stem cells have been induced to differentiate into cells outside the expected neural lineage and conversely stem cells from nonneural tissue have been shown to transdifferentiate into cells with distinct neural phenotypes At the moment there is an accelerated effort to identify a readily ava able socially acceptable stem cell that can be induced to proliferate in an und ferentiated state and that can be manipulated at will to generate diverse cells types We are on the threshold of a great new therapeutic era of cellular therapy that has as great if not greater potential as the current pharmacologic era g rified by antibiotics anesthetics pain killers immunosuppressants and psyc tropics Human Neural Stem Cells Leonora Buzanska, 2018-09-12 This book summarizes early pioneering achievements in the field of human neural stem cell hNSC research and combines them with the latest advances in stem cell technology including reprogramming and gene editing The powerful potential of hNSC to generate and repair the developing and adult CNS has been confirmed by numerous experimental in vitro and in vivo studies The book presents methods for hNSC derivation and discusses the mechanisms underlying NSC in vitro fate decisions and their in vivo therapeutic mode of action The long standing dogma that the human central nervous system CNS lacks the ability to regenerate was refuted at the end of the 20th century when evidence of the presence of neurogenic zones in the adult human brain was found These neurogenic zones are home to human neural stem cells hNSCs which are capable of self renewing and differentiating into neurons astrocytes and oligodendrocytes NSCs isolated from human CNS have a number of clinical advantages especially the innate potential to differentiate into functional neural cells Nevertheless their full clinical exploitation has been hindered by limited access to the tissue and low expansion potential The search for an alternative to CNS sources of autologous therapeutically competent

hNSCs was the driving force for the many studies proving the in vitro plasticity of different somatic stem cells to generate NSCs and their functional progeny. Now the era of induced pluripotent stem cells has opened entirely new opportunities to achieve research and therapeutic goals with the aid of hNSCs.

Stem Cells and Regenerative Medicine Philippe Taupin, 2008. The subject of this book is stem cell research and regenerative medicine. Stem cells are undifferentiated cells that have the ability to differentiate into different lineages of the body. Stem cells carry tremendous potential for the treatment of a broad range of disease and injuries. Stem cells exist in embryonic, fetal, and adult tissues, including the adult central nervous system. This book aims at in depth the recent developments in stem cell research and regenerative medicine. Though this book encompasses all the fields of stem cell research and regenerative medicine, it emphasises adult neurogenesis and neural stem cell research and therapy.

Encyclopedia of Stem Cell Research, 2008. Provides an understanding of the basic concepts in stem cell biology and addresses the politics, ethics, and challenges currently facing the field. From publisher description.

Stem Cell Technologies in Neuroscience Amit K. Srivastava, Evan Y. Snyder, Yang D. Teng, 2017. This volume provides comprehensive knowledge on the fundamental techniques and detailed laboratory protocols used in stem cell research and their potential application in the field of neuroscience. The chapters in this book cover detailed descriptions of techniques for isolation, maintenance, differentiation, and characterization of neural stem cells and the development of in vitro stem cell based neurological disease model. There are detailed methods on leading techniques for stem cell genetic engineering and intra organ transplantation for research and therapeutic purposes, in vivo imaging of donor stem cells, and essential requirements for setting up a new stem cell laboratory. Neuromethods series offers chapters with key advice and procedure specifics to empower the readers to successfully achieve their own scientific and experimental goals. Cutting edge and pragmatic. Stem Cell Technologies in Neuroscience is a valuable resource for academic and translational researchers, industry scientists, biology teachers, and life science graduate students to grasp the vital pulse of the rapidly growing field of stem cell research.

Neural Stem Cells and Cellular Therapy Philippe Taupin, 2010. Over the past decade or so, studies have revealed and confirmed that new nerve cells are generated in the adult brain of mammals, including humans. These new nerve cells originate from cells referred to as neural stem cells. Neural stem cells have the capacity to generate nerve cells and repair the brain. Hence, contrary to a long held dogma, neural stem cells reside in the adult brain, and therefore the adult brain has the capacity of, and may be amenable to, repair. Adult neurogenesis and neural stem cells offer new avenues and opportunities for the treatment and cure of a broad range of neurological diseases, disorders, and injuries. Neural stem cells and cellular therapy aims at providing an overview and in depth analysis of recent developments in neural stem cell research and therapy. This book is composed of recently published review articles that went through the peer review process.
