Spatial Interpolation of Radicalization in Syrian Social Media      *Drug Discovery and Evaluation: Safety and Pharmacokinetic Assays* Franz J. Hock, Michael K. Pugsley, 2024-10-21

Many aspects of drug safety have become an outstanding and even persistent issue and may occur during the process of both drug discovery and development. Until 15 years ago, drug discovery and evaluation was primarily a sequential process starting with the selection of the most pharmacologically active compound from a series of newly synthesized small molecule chemical series by means of distinctive pharmacological assays. Safety aspects were addressed by evaluation of the selected compound at high doses in a series of specific studies directed at indications other than the intended indication of the new compound. These tests are then followed by pharmacokinetic studies which are primarily conducted to confirm whether the selected compound possesses a suitable half life for sufficient exposure and efficacy and whether it has the desired properties specific to the intended route of administration. Safety aspects relied predominantly on the conduct of single and repeat toxicology dose studies which inform changes in organ structure rather than organ function. Both toxicological and pharmacokinetic studies are adapted to the progress of studies in clinical pharmacology and clinical trials. The new edition of this well and broadly accepted reference work contains several innovative and distinguished chapters. This sequential strategy has been abandoned with this new version of the book for several reasons. Of the possible multitude of negative effects that novel drugs may impart on organ function, e.g. ventricular tachy arrhythmia, many are detected too late in non clinical studies to inform clinicians. On the other hand, negative findings in chronic toxicity studies in animals may turn out to be irrelevant for human beings. New scientific approaches, e.g. high throughput screening, human pluripotent stem cells, transgenic animals, knock out animals, in silico models, pharmacogenomics and pharmacoproteomics, as well as Artificial Intelligence (AI) methods, offered new possibilities. There are several examples that show that the druggability of compounds was considerably underestimated when the probability of success of a new project was assessed. The success rate in the pharmaceutical industry and the introduction of new chemical entities to the market per year dropped dramatically, whereas the development time for a new compound increased, sometimes exceeding the patent protection. Research and development scientists, involving the following changes, therefore adopted a change of strategy: Parallel instead of sequential involvement of the various disciplines; multidimensional compound optimization. The term Safety Pharmacology was coined. The International Conference on Harmonization (ICH) founded a Safety Pharmacology Working Group and the Safety Pharmacology Society (SPS) was launched. The discipline provided for evaluation, development and validation of a multitude of safety tests outlined in the Core Battery of Studies Characterizing the exposure profile of a drug by conducting pharmacokinetic studies that evaluate the absorption, distribution, metabolism and excretion should to be investigated at an early stage of development as results contribute to the selection of a compound for further development. Advancements in Toxicology were achieved by the introduction of new methods, e.g. in silico methods, genetic toxicology, computational toxicology and AI. The book is a landmark in the continuously changing world of drug

research and developments As such it is essential reading for many groups not only for all students of pharmacology and toxicology but also for industry scientists and physicians especially those involved in clinical trials of drugs and for pharmacists who must know the safety requirements of drugs The book is essential for scientists and managers in the pharmaceutical industry who are involved in drug discovery drug development and decision making in the development process In particular the book will be of use to government institutions and committees working on official guidelines for drug evaluation worldwide

*Biomarkers and Immunotherapy of Hepatic-Biliary-Pancreatic Cancers* Yunfei Xu,Hongda Liu,Xuesong Gu,Zheng Gong,2024-02-29 Hepatic biliary pancreatic cancers mainly including hepatocellular carcinoma cholangiocarcinoma gallbladder cancer are highly aggressive malignancies with few treatment options and poor prognoses Effects of the traditional systemic treatments such as chemotherapy and radiotherapy are quite limited to hepatic biliary pancreatic cancers For the patients who suffer from hepatic biliary pancreatic cancer and lose the

opportunity of radical surgery few targeted drugs are available Even for the drugs in clinical trial potential drug targets and prognostic biomarkers for hepatic biliary pancreatic cancer are less studied compared to other common cancers such as lung cancer Prognostic biomarker study is the initiation to explore new drug targets and revelation of the underlying mechanisms of tumor progression Immunotherapy especially PD1 or PD L1 antagonists has exhibited potent treatment effects on cancers To date many PD1 drugs are available for cancer treatment and more than one hundred PD1 drugs are in clinical trial However how to screen out the sensitive patients and predict the efficacy of immunotherapy are still unsolved problems Moreover the predictive biomarkers and treatment guidelines of immunotherapy for hepatobiliary tumors are barely investigated      *Sri Lanka National Bibliography* ,2015
