Pathogenic Neisseria Genomics Molecular Biology And Disease Intervention:

Pathogenic Neisseria John K. Davies (Microbiologist), Charlene M. Kahler, 2014 The human pathogens *Neisseria meningitidis* and *Neisseria gonorrhoeae* are exquisitely adapted to life within the human mucosa their only natural niche *N meningitidis* is the causative agent of rapidly transmissible meningitis and septic shock Vaccines developed to control this pathogen can be rendered ineffective by the pathogen's ability to undergo antigenic variation In contrast there are no current vaccination prospects for *N gonorrhoeae* the causative agent of sexually transmitted gonorrhoea Historically infections caused by *N gonorrhoeae* were treated with antibiotics However the recent advent of new strains with resistance to all known antibiotics is causing such treatment regimes to fail necessitating the need for new and more effective control strategies In this book leading *Neisseria* authorities review the most important research on pathogenic *Neisseria* to provide a timely overview of the field The topics covered include the link between pathogenesis and important metabolic pathways vaccine development antibiotic resistance transcriptomics of regulatory networks regulatory small RNAs interactions with neutrophils advances in humanized mouse models An essential guide for research scientists advanced students clinicians and other professionals working with *Neisseria* the book is a recommended text for all microbiology libraries Bacterial Cell Wall Structure and Dynamics Tobias Dörr, Partick J. Moynihan, Christoph Mayer, 2019-12-27 Bacterial cells are encased in a cell wall which is required to maintain cell shape and to confer physical strength to the cell The cell wall allows bacteria to cope with osmotic and environmental challenges and to secure cell integrity during all stages of bacterial growth and propagation and thus has to be sufficiently rigid Moreover to accommodate growth processes the cell wall at the same time has to be a highly dynamic structure During cell enlargement division and differentiation bacteria continuously remodel degrade and resynthesize their cell wall but pivotally need to assure cell integrity during these processes Finally the cell wall is also adjusted according to both environmental constraints and metabolic requirements However how exactly this is achieved is not fully understood The major structural component of the bacterial cell wall is peptidoglycan PG a mesh like polymer of glycan chains interlinked by short chain peptides constituting a net like macromolecular structure that has historically also termed murein or murein sacculus Although the basic structure of PG is conserved among bacteria considerable variations occur regarding cross bridging modifications and attachments Moreover different structural arrangements of the cell envelope exist within bacteria a thin PG layer sandwiched between an inner and outer membrane is present in Gram negative bacteria and a thick PG layer decorated with secondary glycopolymers including teichoic acids is present in Gram positive bacteria Furthermore even more complex envelope structures exist such as those found in mycobacteria Crucially all bacteria possess a multitude of often redundant lytic enzymes termed autolysins and other cell wall modifying and synthesizing enzymes allowing to degrade and rebuild the various structures covering the cells However how cell wall turnover and cell wall biosynthesis are coordinated during different stages of bacterial growth is currently

unclear The mechanisms that prevent cell lysis during these processes are also unclear This Research Topic focuses on the dynamics of the bacterial cell wall its modifications and structural rearrangements during cell growth and differentiation It pays particular attention to the turnover of PG its breakdown and recycling as well as the regulation of these processes Other structures for example secondary polymers such as teichoic acids which are dynamically changed during bacterial growth and differentiation are also covered In recent years our view on the bacterial cell envelope has undergone a dramatic change that challenged old models of cell wall structure biosynthesis and turnover This collection of articles aims to contribute to new understandings of bacterial cell wall structure and dynamics

Microbial Pathogenomics Hilde de Reuse, Stefan Bereswill, 2009-01-01 Microbial Pathogenomics contains a unique collection of reviews demonstrating how genomics has revolutionized our understanding of virulence host adaptation strategies and the evolution of bacterial pathogens Current technologies computational tools and functional approaches to genome analysis are carefully documented and clearly illustrated These include visualization tools for genome comparison databases in silico metabolic reconstructions and function prediction as well as interactomics for the study of protein protein interactions The concepts of pan genomics and reverse vaccinology are introduced as strategies when addressing the challenge presented by bacterial diversity in the prevention and treatment of infectious diseases The authors explore individual bacterial pathogens and discuss the mechanisms that have contributed to their evolutionary success Special cases of host adaptation for example are illustrated by Helicobacter pylori and Mycobacterium tuberculosis which are human specific and highly persistent further bacteria discussed include Escherichia coli Campylobacter Pseudomonas Legionella Bartonella Burkholderia and Staphylococcus Microbial Pathogenomics provides the reader with a global view of key aspects and future trends in bacterial pathogenomics and evaluates their impact on the understanding and treatment of infectious diseases Well illustrated and accessible to both specialists and nonspecialists it is recommended not only for researchers in

microbiology genomics and biotechnology but also for lecturers and teachers *Synergistic Approaches to Managing Gram-negative Bacterial Resistance* Percy Schröttner, Melanie Lynn Conrad, Andreas Erich Zautner, Boyke Bunk, Hani Harb, 2025-09-11 The rapidly increasing prevalence of multi resistant Gram negative bacteria poses a severe threat to public health globally An in depth understanding of disease development by these bacteria alongside their genomic and phenotypic resistance traits and mechanisms of spread is crucial to counter this risk effectively Recent studies have elucidated some of the critical pathways in bacterial resistance development and disease pathogenesis yet a comprehensive integration of these findings into therapeutic and containment strategies remains partial The need to incorporate the attributes of specific bacterial species and their interactions with host organisms is vital for a holistic approach in tackling antimicrobial resistance This research topic aims to integrate current knowledge on bacterial resistance virulence and host cell interactions into a unified framework The goal is to leverage the synergy from these integrative studies to push forward new insights in disease management focusing notably on treatment and prevention strategies By bridging gaps between direct pathogen research and host associated factors including immune system responses and microbiome interactions this initiative anticipates breakthroughs in understanding and combatting bacterial infections Genetics Abstracts ,2001
