

High engine speed length adjustment

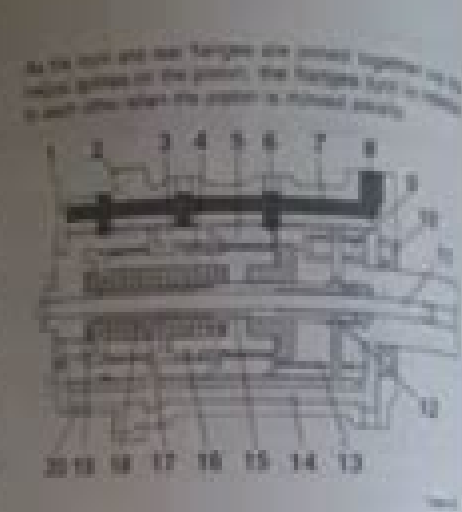

At higher engine speeds the action of pressure is further increased due to the centrifugal force. The control piston (11) is pressed in the direction of the piston (10) until the spring (106) is fully compressed.

Due to the oil pressure against the piston increasing, the piston follows the movement of the control piston.

With the spring fully compressed, the control piston being at position which causes the piston to follow against the pressure (116) before the hole (115) in the control piston and piston.

The passage of oil through the control piston hole is now definitely stopped, which creates vacuum force in the oil pressure directed against the piston, which is now pressed against the adjusting piston (116).

When the piston returns against the adjusting piston, it has reached its end position and the timing adjuster gives maximum length adjustment.
