Pattern Recognition Using Neural and Functional Networks Vasantha Kalyani David, S. Rajasekaran, 2008-11-20

Biologically inspired computing is different from conventional computing. It has a different feel often the terminology does not sound like it talking about machines. The activities of this computing sound more human than mechanistic as people speak of machines that behave, react, self organize, learn, generalize, remember and even to forget. Much of this technology tries to mimic nature's approach in order to mimic some of nature's capabilities. They have a rigorous mathematical basis and neural networks for example have a statistically valid set on which the network is trained.

Two outlines are suggested as the possible tracks for pattern recognition. They are neural networks and functional networks. Neural Networks many interconnected elements operating in parallel carry out tasks that are not only beyond the scope of conventional processing but also cannot be understood in the same terms. Imaging applications for neural networks seem to be a natural fit. Neural networks love to do pattern recognition. A new approach to pattern recognition using microARTMAP together with wavelet transforms in the context of hand written characters, gestures and signatures have been dealt. The Kohonen Network, Back Propagation Networks and Competitive Hopfield Neural Network have been considered for various applications. Functional networks being a generalized form of Neural Networks where functions are learned rather than weights is compared with Multiple Regression Analysis for some applications and the results are seen to be coincident. New kinds of intelligence can be added to machines and we will have the possibility of learning more about learning. Thus our imaginations and options are being stretched. These new machines will be fault tolerant, intelligent and self programming thus trying to make them smarter. So as to make those who use the techniques even smarter. Chapter 1 is a brief introduction to Neural and Functional networks in the context of Pattern recognition using these disciplines. Chapter 2 gives a review of the architectures relevant to the investigation and the development of these technologies in the past few decades. Chapter 3 begins with the look at the recognition of handwritten alphabets using the algorithm for ordered list of boundary pixels as well as the Kohonen Self Organizing Map (SOM). Chapter 4 describes the architecture of the MicroARTMAP and its capability.

Progress in Pattern Recognition, Image Analysis and Applications Alberto Sanfeliu, José F. Martínez Trinidad, Jesús A. Carrasco Ochoa, 2004-10-15. First of all we want to congratulate two new research communities from Mexico and Brazil that have recently joined the Iberoamerican community and the International Association for Pattern Recognition. We believe that the series of congresses that started as the Taller Iberoamericano de Reconocimiento de Patrones (TIARP) and later became the Iberoamerican Congress on Pattern Recognition (CIARP) has contributed to these group consolidation efforts. We hope that in the near future all the Iberoamerican countries will have their own groups and associations to promote our areas of interest and that these congresses will serve as the forum for scientific research exchange, sharing of expertise and new knowledge and establishing contacts that improve cooperation between research

groups in pattern recognition and related areas CIARP 2004 9th Iberoamerican Congress on Pattern Recognition was the ninth in a series of pioneering congresses on pattern recognition in the Iberoamerican community As in the previous year CIARP 2004 also included worldwide participation It took place in Puebla Mexico The aim of the congress was to promote and disseminate ongoing research and mathematical methods for pattern recognition image analysis and applications in such diverse areas as computer vision robotics industry health entertainment space exploration telecommunications data mining document analysis and natural language processing and recognition to name a few

Pattern Recognition J.P. Marques de Sá, 2012-12-06 Pattern recognition currently comprises a vast body of methods supporting the development of numerous applications in many different areas of activity The generally recognized relevance of pattern recognition methods and techniques lies for the most part in the general trend of intelligent task emulation which has definitely pervaded our daily life Robot assisted manufacture medical diagnostic systems forecast of economic variables exploration of Earth's resources and analysis of satellite data are just a few examples of activity fields where this trend applies The pervasiveness of pattern recognition has boosted the number of task specific methodologies and enriched the number of links with other disciplines As counterbalance to this dispersive tendency there have been more recently new theoretical developments that are bridging together many of the classical pattern recognition methods and presenting a new perspective of their links and inner workings This book has its origin in an introductory course on pattern recognition taught at the Electrical and Computer Engineering Department Oporto University From the initial core of this course the book grew with the intent of presenting a comprehensive and articulated view of pattern recognition methods combined with the intent of clarifying practical issues with the aid of examples and applications to real life data The book is primarily addressed to undergraduate and graduate students attending pattern recognition courses of engineering and computer science curricula
