Pattern Detection and Discovery David J Hand, Niall, M. Adams, Richard J. Bolton, 2003-08-02 The collation of large electronic databases of scientific and commercial information has led to a dramatic growth of interest in methods for discovering structures in such databases. These methods often go under the general name of data mining. One important subdiscipline within data mining is concerned with the identification and detection of anomalous or unusual or valuable records or groups of records which we call patterns. Familiar examples are the detection of fraud in credit card transactions of particular coincident purchases in supermarket transactions of important nucleotide sequences in gene sequence analysis and of characteristic traces in EEG records. Tools for the detection of such patterns have been developed within the data mining community but also within other research communities typically without an awareness that the same problem was common to many disciplines. This is not unreasonable: each of these disciplines has a large literature of its own and a literature which is growing rapidly. Keeping up with any one of these is difficult enough, let alone keeping up with others as well, which may in any case be couched in an unfamiliar technical language. But of course this means that opportunities are being lost: discoveries relating to the common problem made in one area are not transferred to the other area and breakthroughs and problem solutions are being rediscovered or not discovered for a long time, meaning that effort is being wasted and opportunities may be lost.

Mathematical Analysis of Urban Spatial Networks Philippe Blanchard, Dimitri Volchenkov, 2008-10-23 Cities can be considered to be among the largest and most complex artificial networks created by human beings. Due to the

numerous and diverse human driven activities urban network topology and dynamics can differ quite substantially from that of natural networks and so call for an alternative method of analysis The intent of the present monograph is to lay down the theoretical foundations for studying the topology of compact urban patterns using methods from spectral graph theory and statistical physics These methods are demonstrated as tools to investigate the structure of a number of real cities with widely differing properties medieval German cities the webs of city canals in Amsterdam and Venice and a modern urban structure such as found in Manhattan Last but not least the book concludes by providing a brief overview of possible applications that will eventually lead to a useful body of knowledge for architects urban planners and civil engineers

Insurance, Biases, Discrimination and Fairness Arthur Charpentier, 2024-05-13 This book offers an introduction to the technical foundations of discrimination and equity issues in insurance models catering to undergraduates postgraduates and practitioners It is a self contained resource accessible to those with a basic understanding of probability and statistics Designed as both a reference guide and a means to develop fairer models the book acknowledges the complexity and ambiguity surrounding the question of discrimination in insurance In insurance proposing differentiated premiums that accurately reflect policyholders true risk termed actuarial fairness or legitimate discrimination is economically and ethically motivated However such segmentation can appear discriminatory from a legal perspective By intertwining real life examples with academic models the book incorporates diverse perspectives from philosophy social sciences economics mathematics and computer science Although discrimination has long been a subject of inquiry in economics and philosophy it has gained renewed prominence in the context of big data with an abundance of proxy variables capturing sensitive attributes and artificial intelligence or specifically machine learning techniques which often involve less interpretable black box algorithms The book distinguishes between models and data to enhance our comprehension of why a model may appear unfair It reminds us that while a model may not be inherently good or bad it is never neutral and often represents a formalization of a

world seen through potentially biased data Furthermore the book equips actuaries with technical tools to quantify and mitigate potential discrimination featuring dedicated chapters that delve into these methods
