Senft, 2012-12-06 DEFINITION AND NOMENCLATURE A Stirling engine is a mechanical device which operates on a closed regenerative thermodynamic cycle with cyclic compression and expansion of the working fluid at different temperature levels The flow of working fluid is controlled only by the internal volume changes there are no valves and overall there is a net conversion of heat to work or vice versa This generalized definition embraces a large family of machines with different functions characteristics and configurations It includes both rotary and reciprocating systems utilizing mechanisms of varying complexity It covers machines capable of operating as a prime mover or power system converting heat supplied at high temperature to output work and waste heat at a lower temperature It also covers work consuming machines used as refrigerating systems and heat pumps abstracting heat from a low temperature source and delivering this plus the heat equivalent of the work consumed to a higher temperature Finally it covers work consuming devices used as pressure generators compressing a fluid from a low pressure to a higher pressure Very similar machines exist which operate on an open regenerative cycle where the flow of working fluid is controlled by valves For convenience these may be called Ericsson engines but unfortunately the distinction is not widely established and regenerative machines of both types are frequently called Stirling engines     Leak-Free Pumps and Compressors Handbook G.
