Molten Salts and Ionic Liquids Marcelle Gaune-Escard,Kenneth R. Seddon,2012-07-02 For many years the related fields of molten salts and ionic liquids have drifted apart to their mutual detriment Both molten salts and ionic liquids are liquid salts containing only ions all that is different is the temperature Both fields involve the study of Coulombic fluids for academic and industrial purposes both employ the same principles both require skilled practitioners both speak the same language all then that is truly different is their semantics and how superficial is that The editors of this book recognising that there was so much knowledge both

empirical and theoretical which can be passed from the molten salt community to the ionic liquid community and vice versa organised a landmark meeting in Tunisia designed to bridge the gap and heal the rift Leaders from both communities met for a week for a mutual exchange with a high tutorial content intermixed with cutting edge findings This volume is a condensate of the principal offerings of that week and emphasises the success which was achieved Indeed four future biannual meetings under the title of EUCHEM Conferences on Molten Salts and Ionic Liquids have now been planned as a direct result of this meeting of minds Topics discussed in this volume include structure dynamics electrochemistry interfacial and thermodynamic properties spectroscopy synthesis and theoretical studies Experimental and theoretical methods for investigating these data are elaborated as are techniques for data collection and analysis This book represents the first serious discussion on the transfer of these methods and techniques between the differing temperature regimes and is a major contribution to the future of both fields

High-Throughput Analysis Radislav A. Potyrailo, Eric J. Amis, 2012-12-06 This book edited by Potyrailo and Amis addresses a new paradigm shifting approach in the search for new materials Combinatorial Materials Science One way to consider such an approach is to imagine an adventurous chef who decides to look for new entrees by cooking food ingredients in many pots using different combinations in every pot and boiling steaming or frying them in various ways Although most of the pots will not have the tastiest food ever devised some recipes will taste intriguing and some eventually will lead to a discovery of a new fascinating cuisine Of course having a skilled chef design the combinatorial formulation will certainly be helpful in ensuring a successful outcome Similar to food each engineering material is a complex product of its chemical composition structure and processing Generally each of these components matters change one and you get another material Most of these new materials will be less good than ones we use now since existing materials have been refined with the extensive work of scientists and engineers At the same time if one prepares diverse materials like our adventurous chef changing material composition processing conditions and time etc some of these materials will be superior to existing ones and a few might represent breakout technology

Data Mining in Crystallography D. W. M. Hofmann, Liudmila N. Kuleshova, 2009-12-24 Humans have been manually extracting patterns from data for centuries but the increasing volume of data in modern times has called for more automatic approaches Early methods of identifying patterns in data include Bayes theorem 1700s and Regression analysis 1800s The proliferation ubiquity and increasing power of computer technology has increased data collection and storage As data sets have grown in size and complexity direct hands on data analysis has increasingly been augmented with indirect automatic data processing

Data mining has been developed as the tool for extracting hidden patterns from data by using computing power and applying new techniques and methodologies for knowledge discovery This has been aided by other discoveries in computer science such as Neural networks Clustering Genetic algorithms 1950s Decision trees 1960s and Support vector machines 1980s Data mining commonly involves four classes of tasks Classification Arranges the data into predefined groups For example an e mail program might attempt to classify an e mail as legitimate or spam Common algorithms include Nearest neighbor Naive Bayes classifier and Neural network Clustering Is like classification but the groups are not predefined so the algorithm will try to group similar items together Regression Attempts to find a function which models the data with the least error A common method is to use Genetic Programming Association rule learning Searches for relationships between variables For example a supermarket might gather data of what each customer buys
