Mechanised shield tunnelling has developed considerably since the publication of the first edition of this book. Challenging tunnel projects under difficult conditions demand innovative solutions which has led to constant further development and innovation in process technology, construction operations and the machines and materials used. The book collects the latest state of technology in mechanised shield tunnelling. It describes the basics of mechanised tunnelling technology and the various types of machines and gives calculation methods and structural advice. Further chapters cover excavation tools, muck handling, tunnel support, surveying and steering as well as workplace safety. There is also detailed information about contractual aspects and process controlling.

Mechanised Shield Tunnelling Bernhard Maidl, Martin

Herrenknecht, Lothar Anheuser, 1996-12-16 Since its early beginnings in 1806 this type of tunnelling has become one of the most important techniques. While Japan's current pioneering role cannot be denied, the state of development in Europe has reached a high level of international recognition. This book explains the history of this construction method, outlining basic information and presenting the various types of shields and linings with the corresponding equipment and range of applications. It examines various projects including not only such large ones as the Channel or the Belt tunnel but also small equally interesting projects such as underground railways. The problems involved as well as the technology used to confront them are fully described and the text is structured in such a way that readers are led from the basics of this construction method via the essential functional elements of the shield machines and on to the different types of shields. The universality of the book is guaranteed by the three expert authors: a researcher, machine manufacturer and contractor respectively. Invaluable for current and future tunnelling projects and a must for all those working in the field.
