Salinity Tolerance in Plants: Methods, Mechanisms and Management 2nd Ed B. K. Garg, I.C. Gupta, 2019-03-01

Salinity tolerance in plants is a complex problem encompassing numerous morphological physiological and biochemical processes and adaptations at the cellular sub cellular and whole plant levels The book comprising eleven chapters deals with diverse aspects of salt tolerance including plant response to salinity and sodicity crop tolerance at different growth stages and criteria for evaluating the same The mechanism of salt injury viz osmotic ionic and nutrient imbalance has been dealt with adopting an integrated approach Likewise the recent information on photosynthesis respiration carbohydrate nitrogen and protein metabolism enzyme dynamics and plant hormones as well as nodulation and symbiotic nitrogen fixation in legumes has been elaborated comprehensively Special attention has been given to the interaction between essential nutrients and salinity as it is vital for alleviation of adverse effects of salt stress The synthesis of knowledge on different mechanisms of salt resistance including osmoregulation with organic and inorganic solutes has also been presented Various methods of introducing salt tolerance in plants such as breeding genetic variations physiological approaches tissue culture somaclonal variation somatic hybridation and recombinant DNA technology have been discussed The nature and properties of salt affected soils and groundwaters and principles for amelioration and management of these critical problems have been included in this book Furthermore Afforestation and Agroforestry techniques for salt affected soils with emphasis on salt tolerant tree species and suitable tree crop combinations also find their much needed due space in the present book

Towards the rational use of high salinity tolerant plants Helmut Lieth, A.A. Al Masoom, 2012-12-06 The Symposium on high salinity tolerant plants held at the University of Al Ain in December 1990 dealt primarily with plants tolerating salinity levels exceeding that of ocean water and which at the same time are promising for utilization in agriculture or forestry These plants could be very useful for a country like the UAE where fresh water resources are very scarce and the groundwater available at some places is already very salty More than 60 million woody trees shrubs have been planted so far and more are planned for the inland plains underlain with brackish groundwater These species were no solution for the widely barren shoreline of the UAE Here mangrove species were of potential use and one species *Avicennia Marina* occurs widely and has been successfully planted for about a decade Converting the tree plantations into economically useful cropping systems is still a problem requiring much research and development The book deals in several sections with conventional irrigation systems using marginal water The species used in these systems are mostly hybrids of conventional crops The irrigation systems however have similar problems as may be expected for irrigation with seawater Papers show the participants experiments in this area The volume serves as a link between scientists working for the improvement of classical irrigation systems and those interested in the application of a new dimension of salinity levels for irrigation water

Physiological and Molecular Characterization of Crop Resistance to Abiotic

Stresses Monica Boscaiu, Ana Fita, 2020-12-02 Abiotic stress represents the main constraint for agriculture affecting plant growth and productivity worldwide Yield losses in agriculture will be potentiated in the future by global warming increasing contamination and reduced availability of fertile land The challenge for agriculture of the present and future is that of increasing the food supply for a continuously growing human population under environmental conditions that are deteriorating in many areas of the world Minimizing the effects of diverse types of abiotic stresses represents a matter of general concern Research on all topics related to abiotic stress tolerance from understanding the stress response mechanisms of plants to developing cultivars and crops tolerant to stress is a priority This Special Issue is focused on the physiological and molecular characterization of crop resistance to abiotic stresses including novel research reviews and opinion articles covering all aspects of the responses and mechanisms of plant tolerance to abiotic Contributions on physiological biochemical and molecular studies of crop responses to abiotic stresses the description and role of stress responsive genes marker assisted screening of stress tolerant genotypes genetic engineering and other biotechnological approaches to improve crop tolerance were considered Evolution of Effective and Economical Reclamation Technology

Salinity: Environment — Plants — Molecules André Läuchli, Ulrich Lüttge, 2007-05-08 In biology the very big global and thevery small molecular issues currently appear to be in the limelight of public interest and research funding policies They are in danger of drifting apart from each other They apply very coarse and very fine scaling respectively but coherence is lost when the various intermediate levels of different scales are neglected Regarding SALINITY we are clearly dealing with a global problem which due to progressing salinization of arable land is of vital interest for society Explanations and basic understanding as well as solutions and remedies may finally lie at the molecular level It is a general approach in science to look for understanding of any system under study at the next finer or lower level of scaling This in itself shows that we need a whole ladder of levels with increasingly finer steps from the global impact to the molecular bases of SALINITY relations It is in this vein that the 22 chapters of this book aim at providing an integrated view of SALINITY

Crop Physiology Case Histories for Major Crops Victor Sadras, Daniel Calderini, 2020-12-05 *Crop Physiology Case Histories of Major Crops* updates the physiology of broad acre crops with a focus on the genetic environmental and management drivers of development capture and efficiency in the use of radiation water and nutrients the formation of yield and aspects of quality These physiological process are presented in a double context of challenges and solutions The challenges to increase plant based food fodder fiber and energy against the backdrop of population increase climate change dietary choices and declining public funding for research and development in agriculture are unprecedented and urgent The proximal technological solutions to these challenges are genetic improvement and agronomy Hence the premise of the book is that crop physiology is most valuable when it engages
