Mechanisms Of Differentiation Volume Ii 002:

Mechanisms of Differentiation Paul B. Fisher, 1990-09-20 Significant recent advances in cell culture technology now permit a detailed biochemical and molecular analysis of differentiation in both normal and tumor cells These studies are important in attempting to understand the complex factors involved in normal growth and development as well as the abnormalities associated with carcinogenesis Mechanisms of Differentiation Volumes I and II is comprised of review chapters addressing various topics of current interest in this important area of research Topics discussed include genes controlling differentiation changes in gene expression during differentiation induction of differentiation induction of differentiation as a mode of action of chemotherapeutic agents and the effect of cell shape growth factors and differentiation modulating agents on the differentiated cell phenotype Mechanisms of Differentiation is valuable to researchers involved in differentiation and development carcinogenesis cell biology chemotherapy and immunology **National Library of Medicine Current**

established Overactivation of the immune system caused by periodontal inflammation may contribute to the worsening of systemic diseases such as diabetes rheumatoid arthritis and atherosclerosis As a multifactorial disease the study of periodontitis involves understanding the interaction between pathogens and host Advances in systems biology and omics technologies allow for a better investigation of this interaction both from the point of view of the microbial community and molecular markers for diagnosis and prognosis In addition modern sequencing and bioinformatics tools allow the investigation of mechanisms involved in the pathogenesis of periodontitis and its relation to other diseases using human samples
