

Experiment no 09.

AIM: To conduct experiment of trifilar suspension.

APPARATUS REQUIRED: Main frame, Trifilar suspension, Weights, Stopwatch, Thread.

INTRODUCTION:

Trifilar Suspension (Torsional Pendulum) :- It is also used to find the moment of inertia of a body experimentally. The body (say a disc or flywheel) whose moment of inertia is to be determined is suspended by three long flexible wires A, B and C, as shown in fig.-b. When the body is twisted about its axis through a small angle θ and then released, it will oscillate with simple harmonic motion. Trifilar suspension is a disc of mass m (weight w) suspended by three vertical cords, each of length l , from a fixed support. Each cord is symmetrically attached to the disc at the same distance r from the mass of the disc.

THEORY:

The disc is now turned through a small angle its vertical axis, the cords become inclined. On being released the disc will perform oscillations about the vertical axis. At any instant

Let: θ = angular displacement of the disc

F = tension in each cord = $w/3$

Inertia torque = $I \times \alpha$

Restoring torque = $3 \times$ horizontal component forces of each string $\times r$

Inertia torque = restoring torque

Mechanical Vibration and Shock Analysis, Random Vibration Christian Lalanne, 2013-03-04
Mechanical Vibration and Shock Analysis Second Edition Volume 3 Random Vibration The vast majority of vibrations encountered in a real world environment are random in nature Such vibrations are intrinsically complicated but this volume describes a process enabling the simplification of the analysis required and the analysis of the signal in the frequency domain Power spectrum density is also defined with the requisite precautions to be taken in its calculation described together with the processes windowing overlapping necessary for improved results A further complementary method the analysis of statistical properties of the time signal is described This enables the distribution law of the maxima of a random Gaussian signal to be determined and simplifies calculation of fatigue damage to be made by the avoidance of the direct counting of peaks The Mechanical Vibration and Shock Analysis five volume series has been written with both the professional engineer and the academic in mind Christian Lalanne explores every aspect of vibration and shock two fundamental and extremely significant areas of mechanical engineering from both a theoretical and practical point of view The five volumes cover all the necessary issues in this area of mechanical engineering The theoretical analyses are placed in the context of both the real world and the laboratory which is essential for the development of specifications

Hill,Valerio Mazzoni,Nataša Stritih-Peljhan,Meta Virant-Doberlet,Andreas Wessel,2022-05-24 Biotremology is a new and emerging discipline in biological sciences that covers all aspects of behavior associated with substrate borne mechanical waves This volume provides state of the art reviews and technical contributions from leading experts and invited younger researchers on topics from signal production and transmission to perception in its ecological context Reviews about the knowledge of well studied groups are complemented with perspectives on the study of less explored groups or contexts Special attention is given to practical issues in measuring substrate borne vibrations as well as to applied biotremology The book appeals to all those interested in communication and vibrational behavior *The Effects of Whole-Body Vibration* Heinrich Dupuis,Georg Zerlett,2012-12-06 The observations made by Paracelsus concerning the dose effect relationship of poison are generally just as applicable to health threatening vibration With regard to kind intensity and duration of the vibration the dose is decisive as to whether the consequences are detrimental unmeaningful or tolerable with respect to health This law of nature determines the tasks and goals of those whose aim is to safeguard health Researchers worldwide have been occupying themselves with this many faceted question

for some time how mechanical vibration affects the human organism and at what point damage occurs. If prevention in occupational medicine is to succeed it is most important that the gaps in our present knowledge be closed for if technical preventive measures are to be effective and preventive means in occupational medicine successful they must be based on reliable and complete findings. Whenever many independent researchers have worked in a given field for a long period a comprehensive intermediate assessment is appropriate to evaluate the level achieved and the direction the research is going. In the area of hand arm vibration this evaluation has already been carried out and the response aroused by this particular research report had led to a demand for a comparable evaluation of the research results on whole body vibration. This report presents clearly and exhaustively the current status of international knowledge as well as the questions that remain to be answered.
