Systems Life Cycle Costing John V. Farr, 2011-06-20 Although technology and productivity has changed much of engineering, many topics are still taught in very similar ways to how they were taught in the 70s. Using a new approach to engineering economics, *Systems Life Cycle Costing: Economic Analysis, Estimation and Management* presents the material that a modern engineer must understand to work as a practicing engineer conducting economic analysis. Organized around a product development process that provides a framework for the material, the book presents techniques such as engineering economics and simulation based costing (SBC) with a focus on total life cycle understanding and perspective and introduces techniques for detailed analysis of modern complex systems. The author includes rules of thumb for estimation grouped with the methods, processes and tools (MPTs) for conducting a detailed engineering buildup for costing. He presents the estimating, costing of complex systems and software and then explores concepts such as design to cost (DTC), cost as an independent variable (CAIV), the role of commercial off the shelf technology, cost of quality and the role of project management in LCC management. No product or services are immune from cost, performance, schedule, quality, risks and tradeoffs. Yet engineers spend most of their formal education focused on performance and most of their professional careers worrying about resources and schedule. Too often the design stage becomes about the technical performance without considering the downstream costs that contribute to the total life cycle costs (LCC) of a system.

This text presents the methods processes and tools needed for the economic analysis estimation and management that bring these costs in line with the goals of pleasing the customer and staying within budget
