Patient Centered Diagnosis Methodologies Individually Diagnostic:

Patient-Centered Diagnosis Kashani-Sabet and Sagebiel Miller, 2015-12-16 Patient centered diagnosis and prognosis focus on individual patients Both rely on a methodology that generates individually tailored probabilistic predictions of a specified medical outcome that a particular patient may experience Predictions are based on observable diagnostic and prognostic factors Because these predictions are both particular outcome specific and individual patient specific achieving predictive accuracy poses a formidable challenge Nevertheless the patient centered methodology PCM appears to produce more accurate individually tailored patient predictions than those typically achieved under current medical practice PCM achieves its greater predictive accuracy by exploiting several analytical devices 1 It redesigns and retools each successive stage of the analytical procedure to predict the particular future outcome that the targeted patient could experience 2 It identifies the existence the direction the shape and the magnitude of each diagnostic and prognostic factor's relationship to the particular outcome as that relationship pertains specifically to patients similar to the targeted patient 3 It relies on detected interrelationships among separate diagnostic and prognostic factors and between both and the specified outcome to fill in missing observations so that an individually tailored probabilistic prediction is possible even with incomplete patient data From a physician's perspective greater accuracy can facilitate better treatment selection choices and other improvements in patient management From a patient's perspective greater accuracy can facilitate more appropriate future planning and lifestyle choices These benefits are illustrated by applying PCM to two diagnostic tests currently offered to cancer patients sentinel lymph node biopsies and FDG PET CT scans and to a novel diagnostic procedure DSSA recently developed to distinguish malignant melanomas from benign nevi ordinary moles PCM appears capable of reducing the cost of these current diagnostic tests by at least 40 percent and of increasing their triage efficiency by at least 66 percent PCM when incorporated within DSSA also appears capable of achieving a sensitivity of 97 percent a specificity of 98 percent and a correct discrimination rate of 97 percent in distinguishing malignant melanomas from benign nevi Patient-Centered Prognosis Miller III, Kashani-Sabet, & Sagebiel, 2013-10-08 Patient centered prognosis focuses on individual patients It is a methodology that generates individually tailored probabilistic predictions of a specified medical outcome that a particular patient may experience Its predictions are based on observable prognostic factors Because these predictions are both particular outcome specific and individual patient specific achieving predictive accuracy poses a formidable challenge Nevertheless the patient centered methodology PCM appears to produce more accurate individually tailored patient predictions than current prognostic practice PCM achieves its greater predictive accuracy by exploiting several analytical devices 1 It redesigns and retools each successive stage of the prognostic procedure to predict the particular future outcome that the targeted patient could experience 2 It identifies the existence the direction the shape and the magnitude of each prognostic factor's relationship to the particular outcome as that relationship pertains specifically to patients similar to the

targeted patient 3 It relies on internal interrelationships among different prognostic factors and the specified outcome to fill in missing observations so that an individually tailored probabilistic prediction is possible even with incomplete patient data PCM is applied to 1 222 melanoma patients from the United States and to 1 225 patients from Finland with invasive breast cancer Substantial improvements in prognostic accuracy are realized in both applications compared to current prognostic practice Greater accuracy can lead to better treatment selection decisions and to other improvements in patient management Greater prognostic accuracy can also eliminate unnecessary medical procedures that are frequently both painful and expensive in treating progressive diseases such as cancer
