Pattern Formations And Oscillatory Phenomena 3 Dynamics Of Droplets:

Pattern Formations and Oscillatory Phenomena Hiroyuki Kitahata, Natsuhiko Yoshinaga, Ken H. Nagai, Yutaka Sumino, 2013-05-09 In this chapter we consider the motion of a droplet and the surrounding flow accompanied by the motion. Our specific attention is on the spontaneous and autonomous motion of a droplet. Such a system has no applied external force and no asymmetry imposed a priori. Nevertheless the droplet moves by consuming energy and by breaking the symmetry of the system. The phenomenon reminds us of biological systems that can also move spontaneously. These systems which are called self-propulsive systems have recently been extensively studied after several model experiments were proposed using chemical reactions. The mechanism of such motion is less clear though theoretical and computational studies have revealed several novel aspects of the motion in contrast with the motion under a given asymmetry. We discuss recently developed experimental systems. Then we focus on a suspended droplet that swims and explain how the result can be analyzed in terms of hydrodynamics by using the concept of surface tension. Finally we apply the method to the analysis of a swimming suspended droplet induced/propelled by a chemical pattern generated inside the droplet. **Pattern Formations and**

Oscillatory Phenomena Shuichi Kinoshita, 2013-05-09 Patterns and their formations appear throughout nature and are studied to analyze different problems in science and make predictions across a wide range of disciplines including biology, physics, mathematics, chemistry, material science, and nanoscience. With the emergence of nanoscience and the ability for researchers and scientists to study living systems at the biological level, pattern formation research has become even more essential. This book is an accessible first of its kind guide for scientists, researchers, engineers, and students who require a general introduction to this research area in order to gain a deeper analytical understanding of the most recent observations and experiments by top researchers in physics. *Pattern Formations* describes the most up-to-date status of this developing field and analyzes the physical phenomena behind a wide range of interesting topics commonly known in the scientific community. The study of pattern formations as a research field will continue to grow as scientists expand their understanding of naturally occurring patterns and mimic nature to help solve complex problems. This research area is becoming more highly recognized due to its contributions to signal processing, computer analysis, image processing, complex networks, development, advancements in optics and photonics, crystallography, metallurgy, drug delivery, chemotherapy, and the further understanding of gene regulation. The only introductory reference book which places special emphasis on the theoretical analyses of experiments in this rapidly growing field of pattern formation. A wide range of physical applications make this book highly interdisciplinary. Explanations of observations and experiments deepen the readers' understanding of this developing research field. Self-organized Motion Satoshi Nakata, Véronique Pimienta, István Lagzi, Hiroyuki Kitahata, Nobuhiko J.

Suematsu, 2018-11-01 The book gives an overview of the self-propelled motion of chemical objects far from their thermodynamic equilibrium at various spatial scales and its applications. The book will discuss theoretical aspects the

characteristics of the motion and design procedures of such systems from the viewpoint of nonlinear dynamics The book is suitable for graduate students and researchers interested in physical and theoretical chemistry as well as soft matter

The Dynamics of Biological Systems Arianna Bianchi, Thomas Hillen, Mark A. Lewis, Yingfei Yi, 2019-10-02 The book presents nine mini courses from a summer school Dynamics of Biological Systems held at the University of Alberta in 2016 as part of the prestigious seminar series Séminaire de Mathématiques Supérieures SMS It includes new and significant contributions in the field of Dynamical Systems and their applications in Biology Ecology and Medicine The chapters of this book cover a wide range of mathematical methods and biological applications They explain the process of mathematical modelling of biological systems with many examples introduce advanced methods from dynamical systems theory present many examples of the use of mathematical modelling to gain biological insight discuss innovative methods for the analysis of biological processes contain extensive lists of references which allow interested readers to continue the research on their own Integrating the theory of dynamical systems with biological modelling the book will appeal to researchers and graduate students in Applied Mathematics and Life Sciences

Drop Heating and Evaporation: Analytical Solutions in Curvilinear Coordinate Systems Gianpietro Elvio Cossali, Simona Tonini, 2020-06-30 This book describes analytical methods for modelling drop evaporation providing the mathematical tools needed in order to generalise transport and constitutive equations and to find analytical solutions in curvilinear coordinate systems Transport phenomena in gas mixtures are treated in considerable detail and the basics of differential geometry are introduced in order to describe interface related transport phenomena One chapter is solely devoted to the description of sixteen different orthogonal curvilinear coordinate systems reporting explicitly on the forms of their differential operators gradient divergent curl Laplacian and transformation matrices The book is intended to guide the reader from mathematics to physical descriptions and ultimately to engineering applications in order to demonstrate the effectiveness of applied mathematics when properly adapted to the real world Though the book primarily addresses the needs of engineering researchers it will also benefit graduate students

From Pattern Formation to Material Computation Jeff Jones, 2015-05-15 This book addresses topics of mobile multi agent systems pattern formation biological modelling artificial life unconventional computation and robotics The behaviour of a simple organism which is capable of remarkable biological and computational feats that seem to transcend its simple component parts is examined and modelled In this book the following question is asked How can something as simple as Physarum polycephalum a giant amoeboid single celled organism which does not possess any neural tissue fixed skeleton or organised musculature can approximate complex computational behaviour during its foraging growth and adaptation of its amorphous body plan and with such limited resources To answer this question the same apparent limitations as faced by the organism are applied using only simple components with local interactions A synthesis approach is adopted and a mobile multi agent system with very simple individual behaviours is employed It is shown their interactions yield emergent behaviour showing complex self organised

pattern formation with material like evolution The presented model reproduces the biological behaviour of Physarum the formation growth and minimisation of transport networks In its conclusion the book moves beyond Physarum and provides results of scoping experiments approximating other complex systems using the multi agent approach The results of this book demonstrate the power and range of harnessing emergent phenomena arising in simple multi agent systems for biological modelling computation and soft robotics applications It methodically describes the necessary components and their interactions showing how deceptively simple components can create powerful mechanisms aided by abundant illustrations supplementary recordings and interactive models It will be of interest to those in biological sciences physics computer science and robotics who wish to understand how simple components can result in complex and useful behaviours and who wish explore the potential of guided pattern formation themselves
